

number link-href text;

1. Two Sum <https://leetcode.com/problems/two-sum> "Given an array of integers, return indices of the two numbers such that they add up to a specific target.

You may assume that each input would have exactly one solution, and you may not use the same element twice.

Example:

Given nums = [2, 7, 11, 15], target = 9,

Because nums[0] + nums[1] = 2 + 7 = 9,
return [0, 1]."

2. Add Two Numbers <https://leetcode.com/problems/add-two-numbers> "You are given two non-empty linked lists representing two non-negative integers. The digits are stored in reverse order and each of their nodes contain a single digit. Add the two numbers and return it as a linked list.

You may assume the two numbers do not contain any leading zero, except the number 0 itself.

Example

Input: (2 -> 4 -> 3) + (5 -> 6 -> 4)

Output: 7 -> 0 -> 8

Explanation: 342 + 465 = 807."

3. Longest Substring Without Repeating Characters <https://leetcode.com/problems/longest-substring-without-repeating-characters> "Given a string, find the length of the longest substring without repeating characters.

Examples:

Given "abcabcbb", the answer is "abc", which the length is 3.

Given "bbbbbb", the answer is "b", with the length of 1.

Given "pwwkew", the answer is "wke", with the length of 3. Note that the answer must be a substring, "pwke" is a subsequence and not a substring."

4. Median of Two Sorted Arrays <https://leetcode.com/problems/median-of-two-sorted-arrays> "There are two sorted arrays nums1 and nums2 of size m and n respectively.

Find the median of the two sorted arrays. The overall run time complexity should be $O(\log(m+n))$.

Example 1:

nums1 = [1, 3]

nums2 = [2]

The median is 2.0

Example 2:

nums1 = [1, 2]

nums2 = [3, 4]

The median is $(2 + 3)/2 = 2.5$ "

5. Longest Palindromic Substring <https://leetcode.com/problems/longest-palindromic-substring> "Given a string s, find the longest palindromic substring in s. You may assume that the maximum length of s is 1000.

Example 1:

Input: "babad"

Output: "bab"

Note: "aba" is also a valid answer.

Example 2:

Input: "cbbd"

Output: ""bb"";

6. ZigZag Conversion <https://leetcode.com/problems/zigzag-conversion> "The string "PAYPALISHIRING" is written in a zigzag pattern on a given number of rows like this: (you may want to display this pattern in a fixed font for better legibility)

```
P   A   H   N
A P L S I I G
Y   I   R
```

And then read line by line: "PAHNAPLSIIGYIR"

Write the code that will take a string and make this conversion given a number of rows:

```
string convert(string s, int numRows);
```

Example 1:

Input: s = "PAYPALISHIRING", numRows = 3
Output: "PAHNAPLSIIGYIR"

Example 2:

Input: s = "PAYPALISHIRING", numRows = 4
Output: "PINALSIGYAHRPI"
Explanation:

```
P       I       N
A    L S   I G
Y A    H R
P       I"";
```

7. Reverse Integer <https://leetcode.com/problems/reverse-integer> "Given a 32-bit signed integer, reverse digits of an integer."

Example 1:

Input: 123
Output: 321

Example 2:

Input: -123
Output: -321

Example 3:

Input: 120
Output: 21

Note:

Assume we are dealing with an environment which could only store integers within the 32-bit signed integer range: $[-2^{31}, 2^{31} - 1]$. For the purpose of this problem, assume that your function returns 0 when the reversed integer overflows."

8. String to Integer (atoi) <https://leetcode.com/problems/string-to-integer-atoi>
"Implement atoi which converts a string to an integer."

The function first discards as many whitespace characters as necessary until the first non-whitespace character is found. Then, starting from this character, takes an optional initial plus or minus sign followed by as many numerical digits as possible, and interprets them as a numerical value.

The string can contain additional characters after those that form the integral number, which are ignored and have no effect on the behavior of this function.

If the first sequence of non-whitespace characters in str is not a valid integral number, or if no such sequence exists because either str is empty or it contains only whitespace characters, no conversion is performed.

If no valid conversion could be performed, a zero value is returned.

Note:

Only the space character ' ' is considered as whitespace character.

Assume we are dealing with an environment which could only store integers within the 32-bit signed integer range: $[-2^{31}, 2^{31} - 1]$. If the numerical value is out of the range of representable values, INT_MAX ($2^{31} - 1$) or INT_MIN (-2^{31}) is returned.

Example 1:

Input: "42"
Output: 42

Example 2:

Input: " -42"
Output: -42
Explanation: The first non-whitespace character is '-', which is the minus sign.
Then take as many numerical digits as possible, which gets 42.

Example 3:

Input: "4193 with words"
Output: 4193
Explanation: Conversion stops at digit '3' as the next character is not a numerical digit.

Example 4:

Input: "words and 987"
Output: 0
Explanation: The first non-whitespace character is 'w', which is not a numerical digit or a +/- sign. Therefore no valid conversion could be performed.

Example 5:

Input: "-91283472332"
Output: -2147483648
Explanation: The number "-91283472332" is out of the range of a 32-bit signed integer.

Therefore INT_MIN (-2^{31}) is returned."

9. Palindrome Number <https://leetcode.com/problems/palindrome-number> "Determine whether an integer is a palindrome. An integer is a palindrome when it reads the same backward as forward."

Example 1:

Input: 121
Output: true

Example 2:

Input: -121
Output: false
Explanation: From left to right, it reads -121. From right to left, it becomes 121-. Therefore it is not a palindrome.

Example 3:

Input: 10
Output: false
Explanation: Reads 01 from right to left. Therefore it is not a palindrome.

Follow up:

Could you solve it without converting the integer to a string?"
 10. Regular Expression Matching <https://leetcode.com/problems/regular-expression-matching> "Given an input string (s) and a pattern (p), implement regular expression matching with support for '.' and '*'.

'.' Matches any single character.

'*' Matches zero or more of the preceding element.

The matching should cover the entire input string (not partial).

Note:

s could be empty and contains only lowercase letters a-z.

p could be empty and contains only lowercase letters a-z, and characters like . or *.

Example 1:

Input:

s = "aa"

p = "a"

Output: false

Explanation: "a" does not match the entire string "aa".

Example 2:

Input:

s = "aa"

p = "a*"

Output: true

Explanation: '*' means zero or more of the preceding element, 'a'. Therefore, by repeating 'a' once, it becomes "aa".

Example 3:

Input:

s = "ab"

p = ".*"

Output: true

Explanation: ".*" means "zero or more (*) of any character (.)".

Example 4:

Input:

s = "aab"

p = "c*a*b"

Output: true

Explanation: c can be repeated 0 times, a can be repeated 1 time. Therefore it matches "aab".

Example 5:

Input:

s = "mississippi"

p = "mis*is*p*."

Output: false

11. Container With Most Water <https://leetcode.com/problems/container-with-most-water> "Given n non-negative integers a₁, a₂, ..., a_n, where each represents a point at coordinate (i, a_i). n vertical lines are drawn such that the two endpoints of line i is at (i, a_i) and (i, 0). Find two lines, which together with x-axis forms a container, such that the container contains the most water.

Note: You may not slant the container and n is at least 2."

12. Integer to Roman <https://leetcode.com/problems/integer-to-roman> "Roman numerals are represented by seven different symbols: I, V, X, L, C, D, and M."

als are represented by seven different symbols: I, V, X, L, C, D and M.

Symbol	Value
I	1
V	5
X	10
L	50
C	100
D	500
M	1000

For example, two is written as II in Roman numeral, just two one's added together. Twelve is written as, XII, which is simply X + II. The number twenty seven is written as XXVII, which is XX + V + II.

Roman numerals are usually written largest to smallest from left to right. However, the numeral for four is not IIII. Instead, the number four is written as IV. Because the one is before the five we subtract it making four. The same principle applies to the number nine, which is written as IX. There are six instances where subtraction is used:

I can be placed before V (5) and X (10) to make 4 and 9.
 X can be placed before L (50) and C (100) to make 40 and 90.
 C can be placed before D (500) and M (1000) to make 400 and 900.

Given an integer, convert it to a roman numeral. Input is guaranteed to be within the range from 1 to 3999.

Example 1:

Input: 3
 Output: "III"

Example 2:

Input: 4
 Output: "IV"

Example 3:

Input: 9
 Output: "IX"

Example 4:

Input: 58
 Output: "LVIII"
 Explanation: C = 100, L = 50, XXX = 30 and III = 3.

Example 5:

Input: 1994
 Output: "MCMXCIV"
 Explanation: M = 1000, CM = 900, XC = 90 and IV = 4."
 13. Roman to Integer <https://leetcode.com/problems/roman-to-integer> "Roman numerals are represented by seven different symbols: I, V, X, L, C, D and M.

Symbol	Value
I	1
V	5
X	10
L	50
C	100
D	500
M	1000

For example, two is written as II in Roman numeral, just two one's added together. Twelve is written as, XII, which is simply X + II. The number twenty seven is written as XXVII, which is XX + V + II.

Roman numerals are usually written largest to smallest from left to right. However, the numeral for four is not IIII. Instead, the number four is written as IV. Because the one is before the five we subtract it making four. The same principle applies to the number nine, which is written as IX. There are six instances where subtraction is used:

I can be placed before V (5) and X (10) to make 4 and 9.
 X can be placed before L (50) and C (100) to make 40 and 90.
 C can be placed before D (500) and M (1000) to make 400 and 900.

Given a roman numeral, convert it to an integer. Input is guaranteed to be within the range from 1 to 3999.

Example 1:

Input: "III"
 Output: 3

Example 2:

Input: "IV"
 Output: 4

Example 3:

Input: "IX"
 Output: 9

Example 4:

Input: "LVIII"
 Output: 58
 Explanation: C = 100, L = 50, XXX = 30 and III = 3.

Example 5:

Input: "MCMXCIV"
 Output: 1994
 Explanation: M = 1000, CM = 900, XC = 90 and IV = 4."
 14. Longest Common Prefix <https://leetcode.com/problems/longest-common-prefix> "Write a function to find the longest common prefix string amongst an array of strings.

If there is no common prefix, return an empty string "".

Example 1:

Input: ["flower", "flow", "flight"]
 Output: "fl"

Example 2:

Input: ["dog", "racecar", "car"]
 Output: ""
 Explanation: There is no common prefix among the input strings.

Note:

All given inputs are in lowercase letters a-z."
 15. 3Sum <https://leetcode.com/problems/3sum> "Given an array nums of n integers, are there elements a, b, c in nums such that a + b + c = 0? Find all unique triplets in the array which gives the sum of zero.

Note:

The solution set must not contain duplicate triplets.

Example:

Given array nums = [-1, 0, 1, 2, -1, -4],

A solution set is:

```
[
  [-1, 0, 1],
  [-1, -1, 2]
]
```

16. 3Sum Closest <https://leetcode.com/problems/3sum-closest> "Given an array nums of n integers and an integer target, find three integers in nums such that the sum is closest to target. Return the sum of the three integers. You may assume that each input would have exactly one solution.

Example:

Given array nums = [-1, 2, 1, -4], and target = 1.

The sum that is closest to the target is 2. (-1 + 2 + 1 = 2)."

17. Letter Combinations of a Phone Number <https://leetcode.com/problems/letter-combinations-of-a-phone-number> "Given a string containing digits from 2-9 inclusive, return all possible letter combinations that the number could represent.

A mapping of digit to letters (just like on the telephone buttons) is given below. Note that 1 does not map to any letters.

Example:

Input: "23"

Output: ["ad", "ae", "af", "bd", "be", "bf", "cd", "ce", "cf"].

Note:

Although the above answer is in lexicographical order, your answer could be in any order you want."

18. 4Sum <https://leetcode.com/problems/4sum> "Given an array nums of n integers and an integer target, are there elements a, b, c, and d in nums such that a + b + c + d = target? Find all unique quadruplets in the array which gives the sum of target."

Note:

The solution set must not contain duplicate quadruplets.

Example:

Given array nums = [1, 0, -1, 0, -2, 2], and target = 0.

A solution set is:

```
[
  [-1, 0, 0, 1],
  [-2, -1, 1, 2],
  [-2, 0, 0, 2]
]
```

19. Remove Nth Node From End of List <https://leetcode.com/problems/remove-nth-node-from-end-of-list> "Given a linked list, remove the n-th node from the end of list and return its head."

Example:

Given linked list: 1->2->3->4->5, and n = 2.

After removing the second node from the end, the linked list becomes 1->2->3->5.

Note:

Given n will always be valid.

Follow up:

Could you do this in one pass?"

20. Valid Parentheses <https://leetcode.com/problems/valid-parentheses> "Given a string containing just the characters '(', ')', '{', '}', '[' and ']', determine if the input string is valid.

An input string is valid if:

Open brackets must be closed by the same type of brackets.
Open brackets must be closed in the correct order.

Note that an empty string is also considered valid.

Example 1:

Input: "()"
Output: true

Example 2:

Input: "()[]{}"
Output: true

Example 3:

Input: "(]"
Output: false

Example 4:

Input: "([)]"
Output: false

Example 5:

Input: "{[]}"
Output: true

21. Merge Two Sorted Lists <https://leetcode.com/problems/merge-two-sorted-lists> "Merge two sorted linked lists and return it as a new list. The new list should be made by splicing together the nodes of the first two lists.

Example:

Input: 1->2->4, 1->3->4
Output: 1->1->2->3->4->4

22. Generate Parentheses <https://leetcode.com/problems/generate-parentheses> "Given n pairs of parentheses, write a function to generate all combinations of well-formed parentheses.

For example, given n = 3, a solution set is:

```
[
  "((()))",
  "(()())",
  "(())()",
  "()()()",
  "()(())"
]
```

23. Merge k Sorted Lists <https://leetcode.com/problems/merge-k-sorted-lists> "Merge k sorted linked lists and return it as one sorted list. Analyze and describe its complexity.

Example:

Input:
[
 1->4->5,
 1->3->4,

2->6

]

Output: 1->1->2->3->4->4->5->6"

24. Swap Nodes in Pairs <https://leetcode.com/problems/swap-nodes-in-pairs> "Given a linked list, swap every two adjacent nodes and return its head."

Example:

Given 1->2->3->4, you should return the list as 2->1->4->3.

Note:

Your algorithm should use only constant extra space.

You may not modify the values in the list's nodes, only nodes itself may be changed."

25. Reverse Nodes in k-Group <https://leetcode.com/problems/reverse-nodes-in-k-group> "Given a linked list, reverse the nodes of a linked list k at a time and return its modified list."

k is a positive integer and is less than or equal to the length of the linked list. If the number of nodes is not a multiple of k then left-out nodes in the end should remain as it is.

Example:

Given this linked list: 1->2->3->4->5

For k = 2, you should return: 2->1->4->3->5

For k = 3, you should return: 3->2->1->4->5

Note:

Only constant extra memory is allowed.

You may not alter the values in the list's nodes, only nodes itself may be changed."

26. Remove Duplicates from Sorted Array <https://leetcode.com/problems/remove-duplicates-from-sorted-array> "Given a sorted array nums, remove the duplicates in-place such that each element appear only once and return the new length."

Do not allocate extra space for another array, you must do this by modifying the input array in-place with O(1) extra memory.

Example 1:

Given nums = [1,1,2],

Your function should return length = 2, with the first two elements of nums being 1 and 2 respectively.

It doesn't matter what you leave beyond the returned length.

Example 2:

Given nums = [0,0,1,1,1,2,2,3,3,4],

Your function should return length = 5, with the first five elements of nums being modified to 0, 1, 2, 3, and 4 respectively.

It doesn't matter what values are set beyond the returned length.

Clarification:

Confused why the returned value is an integer but your answer is an array?

Note that the input array is passed in by reference, which means modification to the input array will be known to the caller as well.

Internally you can think of this:

```
// nums is passed in by reference. (i.e., without making a copy)
int len = removeDuplicates(nums);

// any modification to nums in your function would be known by the caller.
// using the length returned by your function, it prints the first len elements.
for (int i = 0; i < len; i++) {
    print(nums[i]);
}"&
27. Remove Element https://leetcode.com/problems/remove-element "Given an array
nums and a value val, remove all instances of that value in-place and return the new
length.
```

Do not allocate extra space for another array, you must do this by modifying the input array in-place with O(1) extra memory.

The order of elements can be changed. It doesn't matter what you leave beyond the new length.

Example 1:

Given nums = [3,2,2,3], val = 3,

Your function should return length = 2, with the first two elements of nums being 2.

It doesn't matter what you leave beyond the returned length.

Example 2:

Given nums = [0,1,2,2,3,0,4,2], val = 2,

Your function should return length = 5, with the first five elements of nums containing 0, 1, 3, 0, and 4.

Note that the order of those five elements can be arbitrary.

It doesn't matter what values are set beyond the returned length.

Clarification:

Confused why the returned value is an integer but your answer is an array?

Note that the input array is passed in by reference, which means modification to the input array will be known to the caller as well.

Internally you can think of this:

```
// nums is passed in by reference. (i.e., without making a copy)
int len = removeElement(nums, val);

// any modification to nums in your function would be known by the caller.
// using the length returned by your function, it prints the first len elements.
for (int i = 0; i < len; i++) {
    print(nums[i]);
}"&
28. Implement strStr() https://leetcode.com/problems/implement-strstr "Implement strStr().
```

Return the index of the first occurrence of needle in haystack, or -1 if needle is not part of haystack.

Example 1:

Input: haystack = "hello", needle = "ll"

Output: 2

Example 2:

Input: haystack = "aaaaa", needle = "bba"

Output: -1

Clarification:

What should we return when needle is an empty string? This is a great question to ask during an interview.

For the purpose of this problem, we will return 0 when needle is an empty string. This is consistent to C's strstr() and Java's indexOf()."

29. Divide Two Integers <https://leetcode.com/problems/divide-two-integers> "Given two integers dividend and divisor, divide two integers without using multiplication, division and mod operator.

Return the quotient after dividing dividend by divisor.

The integer division should truncate toward zero.

Example 1:

Input: dividend = 10, divisor = 3

Output: 3

Example 2:

Input: dividend = 7, divisor = -3

Output: -2

Note:

Both dividend and divisor will be 32-bit signed integers.

The divisor will never be 0.

Assume we are dealing with an environment which could only store integers within the 32-bit signed integer range: $[-2^{31}, 2^{31} - 1]$. For the purpose of this problem, assume that your function returns $2^{31} - 1$ when the division result overflows."

30. Substring with Concatenation of All Words <https://leetcode.com/problems/substring-with-concatenation-of-all-words> "You are given a string, s, and a list of words, words, that are all of the same length. Find all starting indices of substring(s) in s that is a concatenation of each word in words exactly once and without any intervening characters.

Example 1:

Input:

s = "barfoothefoobarman",
words = ["foo", "bar"]

Output: [0,9]

Explanation: Substrings starting at index 0 and 9 are "barfoo" and "foobar" respectively.

The output order does not matter, returning [9,0] is fine too.

Example 2:

Input:

s = "wordgoodstudentgoodword",
words = ["word", "student"]

Output: []

31. Next Permutation <https://leetcode.com/problems/next-permutation> "Implement next permutation, which rearranges numbers into the lexicographically next greater permutation of numbers.

If such arrangement is not possible, it must rearrange it as the lowest possible order (ie, sorted in ascending order).

The replacement must be in-place and use only constant extra memory.

Here are some examples. Inputs are in the left-hand column and its corresponding outputs are in the right-hand column.

1,2,3 → 1,3,2

3,2,1 & 1,2,3

1,1,5 & 1,5,1"

32. Longest Valid Parentheses <https://leetcode.com/problems/longest-valid-parentheses> "Given a string containing just the characters '(' and ')', find the length of the longest valid (well-formed) parentheses substring.

Example 1:

Input: "()"

Output: 2

Explanation: The longest valid parentheses substring is "()"

Example 2:

Input: "()()()"

Output: 4

Explanation: The longest valid parentheses substring is "()()"

33. Search in Rotated Sorted Array <https://leetcode.com/problems/search-in-rotated-sorted-array> "Suppose an array sorted in ascending order is rotated at some pivot unknown to you beforehand.

(i.e., [0,1,2,4,5,6,7] might become [4,5,6,7,0,1,2]).

You are given a target value to search. If found in the array return its index, otherwise return -1.

You may assume no duplicate exists in the array.

Your algorithm's runtime complexity must be in the order of $O(\log n)$.

Example 1:

Input: nums = [4,5,6,7,0,1,2], target = 0

Output: 4

Example 2:

Input: nums = [4,5,6,7,0,1,2], target = 3

Output: -1"

34. Search for a Range <https://leetcode.com/problems/search-for-a-range> "Given an array of integers nums sorted in ascending order, find the starting and ending position of a given target value.

Your algorithm's runtime complexity must be in the order of $O(\log n)$.

If the target is not found in the array, return [-1, -1].

Example 1:

Input: nums = [5,7,7,8,8,10], target = 8

Output: [3,4]

Example 2:

Input: nums = [5,7,7,8,8,10], target = 6

Output: [-1,-1]"

35. Search Insert Position <https://leetcode.com/problems/search-insert-position> "Given a sorted array and a target value, return the index if the target is found. If not, return the index where it would be if it were inserted in order.

You may assume no duplicates in the array.

Example 1:

Input: [1,3,5,6], 5

Output: 2

Example 2:

Input: [1,3,5,6], 2
Output: 1

Example 3:

Input: [1,3,5,6], 7
Output: 4

Example 4:

Input: [1,3,5,6], 0
Output: 0

36. Valid Sudoku <https://leetcode.com/problems/valid-sudoku> "Determine if a 9x9 Sudoku board is valid. Only the filled cells need to be validated according to the following rules:

Each row must contain the digits 1-9 without repetition.
Each column must contain the digits 1-9 without repetition.
Each of the 9 3x3 sub-boxes of the grid must contain the digits 1-9 without repetition.

A partially filled sudoku which is valid.

The Sudoku board could be partially filled, where empty cells are filled with the character '.'.

Example 1:

Input:

```
[
  ["5","3",".",".","7",".",".","."],
  ["6",".","9","8",".","6","."],
  ["8",".",".","6","3",".","."],
  ["4",".","8",".","3",".","1"],
  ["7",".","2",".","6",".","."],
  [".","6",".","4",".","2","8","."],
  [".",".","4","1","9",".","5"],
  [".","8",".","7","9","."]
]
```

Output: true

Example 2:

Input:

```
[
  ["8","3",".",".","7",".","."],
  ["6",".","9","8",".","6","."],
  ["8",".",".","6","3",".","."],
  ["4",".","8",".","3",".","1"],
  ["7",".","2",".","6",".","."],
  [".","6",".","4",".","2","8","."],
  [".",".","4","1","9",".","5"],
  [".","8",".","7","9","."]
]
```

Output: false

Explanation: Same as Example 1, except with the 5 in the top left corner being modified to 8. Since there are two 8's in the top left 3x3 sub-box, it is invalid.

Note:

A Sudoku board (partially filled) could be valid but is not necessarily solvable

Only the filled cells need to be validated according to the mentioned rules.
 The given board contain only digits 1-9 and the character '.'.
 The given board size is always 9x9."
 37. Sudoku Solver <https://leetcode.com/problems/sudoku-solver> "Write a program to solve a Sudoku puzzle by filling the empty cells.

A sudoku solution must satisfy all of the following rules:

Each of the digits 1-9 must occur exactly once in each row.
 Each of the digits 1-9 must occur exactly once in each column.
 Each of the the digits 1-9 must occur exactly once in each of the 9 3x3 sub-boxes of the grid.

Empty cells are indicated by the character '.'.

A sudoku puzzle...

...and its solution numbers marked in red.

Note:

The given board contain only digits 1-9 and the character '.'.
 You may assume that the given Sudoku puzzle will have a single unique solution.
 The given board size is always 9x9."
 38. Count and Say <https://leetcode.com/problems/count-and-say> "The count-and-say sequence is the sequence of integers with the first five terms as following:

1.	1
2.	11
3.	21
4.	1211
5.	111221

1 is read off as "one 1" or 11.

11 is read off as "two 1s" or 21.

21 is read off as "one 2, then one 1" or 1211.

Given an integer n, generate the nth term of the count-and-say sequence.

Note: Each term of the sequence of integers will be represented as a string.

Example 1:
 Input: 1
 Output: "1"

Example 2:
 Input: 4
 Output: "1211"

39. Combination Sum <https://leetcode.com/problems/combination-sum> "Given a set of candidate numbers (candidates) (without duplicates) and a target number (target), find all unique combinations in candidates where the candidate numbers sums to target.

The same repeated number may be chosen from candidates unlimited number of times.

Note:

All numbers (including target) will be positive integers.
The solution set must not contain duplicate combinations.

Example 1:

Input: candidates = [2,3,6,7], target = 7,
A solution set is:
[
 [7],
 [2,2,3]
]

Example 2:

Input: candidates = [2,3,5], target = 8,
A solution set is:
[
 [2,2,2,2],
 [2,3,3],
 [3,5]
]

40. Combination Sum II <https://leetcode.com/problems/combination-sum-ii> "Given a collection of candidate numbers (candidates) and a target number (target), find all unique combinations in candidates where the candidate numbers sums to target.

Each number in candidates may only be used once in the combination.

Note:

All numbers (including target) will be positive integers.
The solution set must not contain duplicate combinations.

Example 1:

Input: candidates = [10,1,2,7,6,1,5], target = 8,
A solution set is:
[
 [1, 7],
 [1, 2, 5],
 [2, 6],
 [1, 1, 6]
]

Example 2:

Input: candidates = [2,5,2,1,2], target = 5,
A solution set is:
[
 [1,2,2],
 [5]
]

41. First Missing Positive <https://leetcode.com/problems/first-missing-positive>
"Given an unsorted integer array, find the smallest missing positive integer.

Example 1:

Input: [1,2,0]
Output: 3

Example 2:

Input: [3,4,-1,1]
Output: 2

Example 3:

Input: [7,8,9,11,12]
Output: 1

Note:

Your algorithm should run in $O(n)$ time and uses constant extra space."¿
42. Trapping Rain Water <https://leetcode.com/problems/trapping-rain-water> "Given n non-negative integers representing an elevation map where the width of each bar is 1, compute how much water it is able to trap after raining.

The above elevation map is represented by array [0,1,0,2,1,0,1,3,2,1,2,1]. In this case, 6 units of rain water (blue section) are being trapped. Thanks Marcos for contributing this image!

Example:

Input: [0,1,0,2,1,0,1,3,2,1,2,1]
Output: 6"¿

43. Multiply Strings <https://leetcode.com/problems/multiply-strings> "Given two non-negative integers num1 and num2 represented as strings, return the product of num1 and num2, also represented as a string.

Example 1:

Input: num1 = "2", num2 = "3"
Output: "6"

Example 2:

Input: num1 = "123", num2 = "456"
Output: "56088"

Note:

The length of both num1 and num2 is < 110 .

Both num1 and num2 contain only digits 0-9.

Both num1 and num2 do not contain any leading zero, except the number 0 itself.

You must not use any built-in BigInteger library or convert the inputs to integer directly."¿

44. Wildcard Matching <https://leetcode.com/problems/wildcard-matching> "Given an input string (s) and a pattern (p), implement wildcard pattern matching with support for '?' and '*'.

'?' Matches any single character.

'*' Matches any sequence of characters (including the empty sequence).

The matching should cover the entire input string (not partial).

Note:

s could be empty and contains only lowercase letters a-z.

p could be empty and contains only lowercase letters a-z, and characters like ? or *.

Example 1:

Input:
s = "aa"
p = "a"
Output: false
Explanation: "a" does not match the entire string "aa".

Example 2:

Input:
 s = ""aa""
 p = ""*""
 Output: true
 Explanation: '*' matches any sequence.

Example 3:

Input:
 s = ""cb""
 p = ""?a""
 Output: false
 Explanation: '?' matches 'c', but the second letter is 'a', which does not match 'b'.
 .

Example 4:

Input:
 s = ""adceb""
 p = ""*a*b""
 Output: true
 Explanation: The first '*' matches the empty sequence, while the second '*' matches the substring ""dce"".

Example 5:

Input:
 s = ""acdcdb""
 p = ""a*c?b""
 Output: false"

45. Jump Game II <https://leetcode.com/problems/jump-game-ii> "Given an array of n non-negative integers, you are initially positioned at the first index of the array.

Each element in the array represents your maximum jump length at that position.

Your goal is to reach the last index in the minimum number of jumps.

Example:

Input: [2,3,1,1,4]
 Output: 2
 Explanation: The minimum number of jumps to reach the last index is 2.
 Jump 1 step from index 0 to 1, then 3 steps to the last index.

Note:

You can assume that you can always reach the last index."

46. Permutations <https://leetcode.com/problems/permutations> "Given a collection of distinct integers, return all possible permutations.

Example:

Input: [1,2,3]
 Output:
 [
 [1,2,3],
 [1,3,2],
 [2,1,3],
 [2,3,1],
 [3,1,2],
 [3,2,1]
]"

47. Permutations II <https://leetcode.com/problems/permutations-ii> "Given a collection of numbers that might contain duplicates, return all possible unique permutations.

Example:

Input: [1,1,2]
Output:

```
[
  [1,1,2],
  [1,2,1],
  [2,1,1]
]"
```

48. Rotate Image <https://leetcode.com/problems/rotate-image> "You are given an n x n 2D matrix representing an image.

Rotate the image by 90 degrees (clockwise).

Note:

You have to rotate the image in-place, which means you have to modify the input 2D matrix directly. DO NOT allocate another 2D matrix and do the rotation.

Example 1:

Given input matrix =

```
[
  [1,2,3],
  [4,5,6],
  [7,8,9]
],
```

rotate the input matrix in-place such that it becomes:

```
[
  [7,4,1],
  [8,5,2],
  [9,6,3]
]
```

Example 2:

Given input matrix =

```
[
  [ 5, 1, 9,11],
  [ 2, 4, 8,10],
  [13, 3, 6, 7],
  [15,14,12,16]
],
```

rotate the input matrix in-place such that it becomes:

```
[
  [15,13, 2, 5],
  [14, 3, 4, 1],
  [12, 6, 8, 9],
  [16, 7,10,11]
]"
```

49. Group Anagrams <https://leetcode.com/problems/group-anagrams> "Given an array of strings, group anagrams together.

Example:

Input: ["eat", "tea", "tan", "ate", "nat", "bat"],

Output:

```
[
  ["ate","eat","tea"],
  ["nat","tan"],
  ["bat"]
]
```

Note:

All inputs will be in lowercase.

The order of your output does not matter."

50. Pow(x, n) <https://leetcode.com/problems/powx-n> "Implement pow(x, n), which calculates x raised to the power n (xⁿ).

Example 1:

Input: 2.00000, 10
Output: 1024.00000

Example 2:

Input: 2.10000, 3
Output: 9.26100

Example 3:

Input: 2.00000, -2
Output: 0.25000
Explanation: $2^{-2} = 1/2^2 = 1/4 = 0.25$

Note:

$-100.0 < x < 100.0$

n is a 32-bit signed integer, within the range $[-2^{31}, 2^{31} - 1]$

51. N-Queens <https://leetcode.com/problems/n-queens> "The n-queens puzzle is the problem of placing n queens on an $n \times n$ chessboard such that no two queens attack each other.

Given an integer n, return all distinct solutions to the n-queens puzzle.

Each solution contains a distinct board configuration of the n-queens' placement, where 'Q' and '.' both indicate a queen and an empty space respectively.

Example:

Input: 4
Output: [
["..Q..", // Solution 1
 "...Q",
 "Q...",
 "...Q."],

["...Q.", // Solution 2
 "Q...",
 "...Q",
 ".Q.."]
]

Explanation: There exist two distinct solutions to the 4-queens puzzle as shown above.

52. N-Queens II <https://leetcode.com/problems/n-queens-ii> "The n-queens puzzle is the problem of placing n queens on an $n \times n$ chessboard such that no two queens attack each other.

Given an integer n, return the number of distinct solutions to the n-queens puzzle.

Example:

Input: 4
Output: 2
Explanation: There are two distinct solutions to the 4-queens puzzle as shown below.
[
["..Q..", // Solution 1
 "...Q",
 "Q...",
 "...Q."],

["...Q.", // Solution 2
 "Q...",
 "...Q",
 ".Q.."]
]

```

    ".Q..""]
]"¿
53. Maximum Subarray https://leetcode.com/problems/maximum-subarray "Given an integer array nums, find the contiguous subarray (containing at least one number) which has the largest sum and return its sum.

```

Example:

```

Input: [-2,1,-3,4,-1,2,1,-5,4],
Output: 6
Explanation: [4,-1,2,1] has the largest sum = 6.

```

Follow up:

If you have figured out the O(n) solution, try coding another solution using the divide and conquer approach, which is more subtle."¿

```

54. Spiral Matrix https://leetcode.com/problems/spiral-matrix "Given a matrix of m x n elements (m rows, n columns), return all elements of the matrix in spiral order.
.

```

Example 1:

```

Input:
[
  [ 1, 2, 3 ],
  [ 4, 5, 6 ],
  [ 7, 8, 9 ]
]
Output: [1,2,3,6,9,8,7,4,5]

```

Example 2:

```

Input:
[
  [1, 2, 3, 4],
  [5, 6, 7, 8],
  [9,10,11,12]
]
Output: [1,2,3,4,8,12,11,10,9,5,6,7]"¿

```

```

55. Jump Game https://leetcode.com/problems/jump-game "Given an array of non-negative integers, you are initially positioned at the first index of the array.

```

Each element in the array represents your maximum jump length at that position.

Determine if you are able to reach the last index.

Example 1:

```

Input: [2,3,1,1,4]
Output: true
Explanation: Jump 1 step from index 0 to 1, then 3 steps to the last index.

```

Example 2:

```

Input: [3,2,1,0,4]
Output: false
Explanation: You will always arrive at index 3 no matter what. Its maximum jump length is 0, which makes it impossible to reach the last index."¿
56. Merge Intervals https://leetcode.com/problems/merge-intervals "Given a collection of intervals, merge all overlapping intervals.

```

Example 1:

```

Input: [[1,3],[2,6],[8,10],[15,18]]
Output: [[1,6],[8,10],[15,18]]
Explanation: Since intervals [1,3] and [2,6] overlaps, merge them into [1,6].

```

Example 2:

```

Input: [[1,4],[4,5]]

```

Output: [[1,5]]

Explanation: Intervals [1,4] and [4,5] are considered overlapping."

57. Insert Interval <https://leetcode.com/problems/insert-interval> "Given a set of non-overlapping intervals, insert a new interval into the intervals (merge if necessary).

You may assume that the intervals were initially sorted according to their start times.

Example 1:

Input: intervals = [[1,3],[6,9]], newInterval = [2,5]

Output: [[1,5],[6,9]]

Example 2:

Input: intervals = [[1,2],[3,5],[6,7],[8,10],[12,16]], newInterval = [4,8]

Output: [[1,2],[3,10],[12,16]]

Explanation: Because the new interval [4,8] overlaps with [3,5],[6,7],[8,10]."

58. Length of Last Word <https://leetcode.com/problems/length-of-last-word> "Given a string s consists of upper/lower-case alphabets and empty space characters ' ', return the length of last word in the string.

If the last word does not exist, return 0.

Note: A word is defined as a character sequence consists of non-space characters only.

Example:

Input: "Hello World"

Output: 5"

59. Spiral Matrix II <https://leetcode.com/problems/spiral-matrix-ii> "Given a positive integer n, generate a square matrix filled with elements from 1 to n² in spiral order.

Example:

Input: 3

Output:

```
[
  [ 1, 2, 3 ],
  [ 8, 9, 4 ],
  [ 7, 6, 5 ]
]
```

60. Permutation Sequence <https://leetcode.com/problems/permutation-sequence> "The set [1,2,3,...,n] contains a total of n! unique permutations.

By listing and labeling all of the permutations in order, we get the following sequence for n = 3:

```
""123""
""132""
""213""
""231""
""312""
""321""
```

Given n and k, return the kth permutation sequence.

Note:

Given n will be between 1 and 9 inclusive.
Given k will be between 1 and n! inclusive.

Example 1:

Input: n = 3, k = 3

Output: ""213""

Example 2:

Input: n = 4, k = 9

Output: ""2314""

61. Rotate List <https://leetcode.com/problems/rotate-list> "Given a linked list, rotate the list to the right by k places, where k is non-negative."

Example 1:

Input: 1->2->3->4->5->NULL, k = 2

Output: 4->5->1->2->3->NULL

Explanation:

rotate 1 steps to the right: 5->1->2->3->4->NULL

rotate 2 steps to the right: 4->5->1->2->3->NULL

Example 2:

Input: 0->1->2->NULL, k = 4

Output: 2->0->1->NULL

Explanation:

rotate 1 steps to the right: 2->0->1->NULL

rotate 2 steps to the right: 1->2->0->NULL

rotate 3 steps to the right: 0->1->2->NULL

rotate 4 steps to the right: 2->0->1->NULL

62. Unique Paths <https://leetcode.com/problems/unique-paths> "A robot is located at the top-left corner of a m x n grid (marked 'Start' in the diagram below)."

The robot can only move either down or right at any point in time. The robot is trying to reach the bottom-right corner of the grid (marked 'Finish' in the diagram below).

How many possible unique paths are there?

Above is a 7 x 3 grid. How many possible unique paths are there?

Note: m and n will be at most 100.

Example 1:

Input: m = 3, n = 2

Output: 3

Explanation:

From the top-left corner, there are a total of 3 ways to reach the bottom-right corner:

1. Right -> Right -> Down

2. Right -> Down -> Right

3. Down -> Right -> Right

Example 2:

Input: m = 7, n = 3

Output: 28

63. Unique Paths II <https://leetcode.com/problems/unique-paths-ii> "A robot is located at the top-left corner of a m x n grid (marked 'Start' in the diagram below)."

The robot can only move either down or right at any point in time. The robot is trying to reach the bottom-right corner of the grid (marked 'Finish' in the diagram below).

Now consider if some obstacles are added to the grids. How many unique paths would there be?

An obstacle and empty space is marked as 1 and 0 respectively in the grid.

Note: m and n will be at most 100.

Example 1:

Input:

```
[
  [0,0,0],
  [0,1,0],
  [0,0,0]
]
```

Output: 2

Explanation:

There is one obstacle in the middle of the 3x3 grid above.

There are two ways to reach the bottom-right corner:

1. Right -> Right -> Down -> Down

2. Down -> Down -> Right -> Right"

64. Minimum Path Sum <https://leetcode.com/problems/minimum-path-sum> "Given a m x n grid filled with non-negative numbers, find a path from top left to bottom right which minimizes the sum of all numbers along its path."

Note: You can only move either down or right at any point in time.

Example:

Input:

```
[
  [1,3,1],
  [1,5,1],
  [4,2,1]
]
```

Output: 7

Explanation: Because the path 1->3->1->1->1 minimizes the sum."

65. Valid Number <https://leetcode.com/problems/valid-number> "Validate if a given string is numeric."

Some examples:

"0" => true

" 0.1 " => true

"abc" => false

"1 a" => false

"2e10" => true

Note: It is intended for the problem statement to be ambiguous. You should gather all requirements up front before implementing one.

Update (2015-02-10):

The signature of the C++ function had been updated. If you still see your function signature accepts a const char * argument, please click the reload button to reset your code definition."

66. Plus One <https://leetcode.com/problems/plus-one> "Given a non-empty array of digits representing a non-negative integer, plus one to the integer."

The digits are stored such that the most significant digit is at the head of the list, and each element in the array contain a single digit.

You may assume the integer does not contain any leading zero, except the number 0 itself.

Example 1:

Input: [1,2,3]

Output: [1,2,4]

Explanation: The array represents the integer 123.

Example 2:

Input: [4,3,2,1]

Output: [4,3,2,2]

Explanation: The array represents the integer 4321."

67. Add Binary <https://leetcode.com/problems/add-binary> "Given two binary strings, return their sum (also a binary string).

The input strings are both non-empty and contains only characters 1 or 0.

Example 1:

Input: a = "11", b = "1"

Output: "100"

Example 2:

Input: a = "1010", b = "1011"

Output: "10101"

68. Text Justification <https://leetcode.com/problems/text-justification> "Given an array of words and a width maxWidth, format the text such that each line has exactly maxWidth characters and is fully (left and right) justified.

You should pack your words in a greedy approach; that is, pack as many words as you can in each line. Pad extra spaces ' ' when necessary so that each line has exactly maxWidth characters.

Extra spaces between words should be distributed as evenly as possible. If the number of spaces on a line do not divide evenly between words, the empty slots on the left will be assigned more spaces than the slots on the right.

For the last line of text, it should be left justified and no extra space is inserted between words.

Note:

A word is defined as a character sequence consisting of non-space characters only.

Each word's length is guaranteed to be greater than 0 and not exceed maxWidth. The input array words contains at least one word.

Example 1:

Input:

words = ["This", "is", "an", "example", "of", "text", "justification."]

maxWidth = 16

Output:

```
[
  "This    is    an",
  "example of text",
  "justification."
]
```

Example 2:

Input:

words = ["What", "must", "be", "acknowledgment", "shall", "be"]

maxWidth = 16

Output:

```
[
  "What  must  be",
  "acknowledgment",
  "shall be"
]
```

Explanation: Note that the last line is "shall be" instead of "shall be",

because the last line must be left-justified instead of fully-justified.

Note that the second line is also left-justified because it contains only one word.

Example 3:

Input:

```
words = ["Science", "is", "what", "we", "understand", "well", "enough", "to",
        "explain", "to", "a", "computer.", "Art", "is", "everything", "else", "we", "do"]
```

maxWidth = 20

Output:

```
[ "Science is what we",
  "understand well",
  "enough to explain to",
  "a computer. Art is",
  "everything else we",
  "do"
]
```

69. Sqrt(x) <https://leetcode.com/problems/sqrtx> "Implement int sqrt(int x).

Compute and return the square root of x, where x is guaranteed to be a non-negative integer.

Since the return type is an integer, the decimal digits are truncated and only the integer part of the result is returned.

Example 1:

Input: 4

Output: 2

Example 2:

Input: 8

Output: 2

Explanation: The square root of 8 is 2.82842..., and since the decimal part is truncated, 2 is returned."

70. Climbing Stairs <https://leetcode.com/problems/climbing-stairs> "You are climbing a stair case. It takes n steps to reach to the top.

Each time you can either climb 1 or 2 steps. In how many distinct ways can you climb to the top?

Note: Given n will be a positive integer.

Example 1:

Input: 2

Output: 2

Explanation: There are two ways to climb to the top.

1. 1 step + 1 step

2. 2 steps

Example 2:

Input: 3

Output: 3

Explanation: There are three ways to climb to the top.

1. 1 step + 1 step + 1 step

2. 1 step + 2 steps

3. 2 steps + 1 step"

71. Simplify Path <https://leetcode.com/problems/simplify-path> "Given an absolute path for a file (Unix-style), simplify it.

For example,

path = "/home/", => "/home"

path = "/a/./b/../../c/", => "/c"

click to show corner cases.

Corner Cases:

Did you consider the case where path = ""/./""?

In this case, you should return ""/"".

Another corner case is the path might contain multiple slashes '/' together, such as ""/home//foo/"".

In this case, you should ignore redundant slashes and return ""/home/foo/"".

72. Edit Distance <https://leetcode.com/problems/edit-distance> "Given two words word1 and word2, find the minimum number of operations required to convert word1 to word2."

You have the following 3 operations permitted on a word:

- Insert a character
- Delete a character
- Replace a character

Example 1:

Input: word1 = "horse", word2 = "ros"

Output: 3

Explanation:

horse -> rorse (replace 'h' with 'r')

rorse -> rose (remove 'r')

rose -> ros (remove 'e')

Example 2:

Input: word1 = "intention", word2 = "execution"

Output: 5

Explanation:

intention -> inention (remove 't')

inention -> enention (replace 'i' with 'e')

enention -> exention (replace 'n' with 'x')

exention -> exection (replace 'n' with 'c')

exection -> execution (insert 'u')

73. Set Matrix Zeroes <https://leetcode.com/problems/set-matrix-zeroes> "Given a m x n matrix, if an element is 0, set its entire row and column to 0. Do it in-place."

Example 1:

Input:

```
[
  [1,1,1],
  [1,0,1],
  [1,1,1]
]
```

Output:

```
[
  [1,0,1],
  [0,0,0],
  [1,0,1]
]
```

Example 2:

Input:

```
[
  [0,1,2,0],
  [3,4,5,2],
  [1,3,1,5]
]
```

Output:

```
[
  [0,0,0,0],
  [0,4,5,0],
  [0,3,1,0]
]
```

Follow up:

A straight forward solution using $O(mn)$ space is probably a bad idea.

A simple improvement uses $O(m + n)$ space, but still not the best solution.

Could you devise a constant space solution?"

74. Search a 2D Matrix <https://leetcode.com/problems/search-a-2d-matrix> "Write a n efficient algorithm that searches for a value in an $m \times n$ matrix. This matrix has the following properties:

Integers in each row are sorted from left to right.

The first integer of each row is greater than the last integer of the previous row.

Example 1:

Input:

```
matrix = [
  [1, 3, 5, 7],
  [10, 11, 16, 20],
  [23, 30, 34, 50]
]
target = 3
Output: true
```

Example 2:

Input:

```
matrix = [
  [1, 3, 5, 7],
  [10, 11, 16, 20],
  [23, 30, 34, 50]
]
target = 13
Output: false"
```

75. Sort Colors <https://leetcode.com/problems/sort-colors> "Given an array with n objects colored red, white or blue, sort them in-place so that objects of the same color are adjacent, with the colors in the order red, white and blue.

Here, we will use the integers 0, 1, and 2 to represent the color red, white, and blue respectively.

Note: You are not suppose to use the library's sort function for this problem.

Example:

```
Input: [2,0,2,1,1,0]
Output: [0,0,1,1,2,2]
```

Follow up:

A rather straight forward solution is a two-pass algorithm using counting sort.

First, iterate the array counting number of 0's, 1's, and 2's, then overwrite array with total number of 0's, then 1's and followed by 2's.

Could you come up with a one-pass algorithm using only constant space?"

76. Minimum Window Substring <https://leetcode.com/problems/minimum-window-substring> "Given a string S and a string T , find the minimum window in S which will contain all the characters in T in complexity $O(n)$.

Example:

Input: S = "ADOBECODEBANC", T = "ABC"
 Output: "BANC"

Note:

If there is no such window in S that covers all characters in T, return the empty string "".

If there is such window, you are guaranteed that there will always be only one unique minimum window in S."

77. Combinations <https://leetcode.com/problems/combinations> "Given two integers n and k, return all possible combinations of k numbers out of 1 ... n.

Example:

Input: n = 4, k = 2

Output:

```
[
  [2,4],
  [3,4],
  [2,3],
  [1,2],
  [1,3],
  [1,4],
]
```

78. Subsets <https://leetcode.com/problems/subsets> "Given a set of distinct integers s, nums, return all possible subsets (the power set).

Note: The solution set must not contain duplicate subsets.

Example:

Input: nums = [1,2,3]

Output:

```
[
  [3],
  [1],
  [2],
  [1,2,3],
  [1,3],
  [2,3],
  [1,2],
  []
]
```

79. Word Search <https://leetcode.com/problems/word-search> "Given a 2D board and a word, find if the word exists in the grid.

The word can be constructed from letters of sequentially adjacent cell, where "adjacent" cells are those horizontally or vertically neighboring. The same letter cell may not be used more than once.

Example:

board =

```
[
  ['A','B','C','E'],
  ['S','F','C','S'],
  ['A','D','E','E']
]
```

Given word = "ABCCED", return true.

Given word = "SEE", return true.

Given word = "ABCB", return false."

80. Remove Duplicates from Sorted Array II <https://leetcode.com/problems/remove-duplicates-from-sorted-array-ii> "Given a sorted array nums, remove the duplicates in-place such that duplicates appeared at most twice and return the new length.

Do not allocate extra space for another array, you must do this by modifying the input array in-place with O(1) extra memory.

Example 1:

Given nums = [1,1,1,2,2,3],

Your function should return length = 5, with the first five elements of nums being 1, 1, 2, 2 and 3 respectively.

It doesn't matter what you leave beyond the returned length.

Example 2:

Given nums = [0,0,1,1,1,1,2,3,3],

Your function should return length = 7, with the first seven elements of nums being modified to 0, 0, 1, 1, 2, 3 and 3 respectively.

It doesn't matter what values are set beyond the returned length.

Clarification:

Confused why the returned value is an integer but your answer is an array?

Note that the input array is passed in by reference, which means modification to the input array will be known to the caller as well.

Internally you can think of this:

```
// nums is passed in by reference. (i.e., without making a copy)
int len = removeDuplicates(nums);
```

```
// any modification to nums in your function would be known by the caller.
// using the length returned by your function, it prints the first len elements.
for (int i = 0; i < len; i++) {
    print(nums[i]);
}"&
```

81. Search in Rotated Sorted Array II <https://leetcode.com/problems/search-in-rotated-sorted-array-ii> "Suppose an array sorted in ascending order is rotated at some pivot unknown to you beforehand.

(i.e., [0,0,1,2,2,5,6] might become [2,5,6,0,0,1,2]).

You are given a target value to search. If found in the array return true, otherwise return false.

Example 1:

Input: nums = [2,5,6,0,0,1,2], target = 0
Output: true

Example 2:

Input: nums = [2,5,6,0,0,1,2], target = 3
Output: false

Follow up:

This is a follow up problem to Search in Rotated Sorted Array, where nums may contain duplicates.

Would this affect the run-time complexity? How and why?"&

82. Remove Duplicates from Sorted List II <https://leetcode.com/problems/remove-duplicates-from-sorted-list-ii> "Given a sorted linked list, delete all nodes that have duplicate numbers, leaving only distinct numbers from the original list.

Example 1:

Input: 1->2->3->3->4->4->5
Output: 1->2->5

Example 2:

Input: 1->1->1->2->3

Output: 2->3"

83. Remove Duplicates from Sorted List <https://leetcode.com/problems/remove-duplicates-from-sorted-list> "Given a sorted linked list, delete all duplicates such that each element appear only once.

Example 1:

Input: 1->1->2

Output: 1->2

Example 2:

Input: 1->1->2->3->3

Output: 1->2->3"

84. Largest Rectangle in Histogram <https://leetcode.com/problems/largest-rectangle-in-histogram> "Given n non-negative integers representing the histogram's bar height where the width of each bar is 1, find the area of largest rectangle in the histogram.

Above is a histogram where width of each bar is 1, given height = [2,1,5,6,2,3].

The largest rectangle is shown in the shaded area, which has area = 10 unit.

Example:

Input: [2,1,5,6,2,3]

Output: 10"

85. Maximal Rectangle <https://leetcode.com/problems/maximal-rectangle> "Given a 2D binary matrix filled with 0's and 1's, find the largest rectangle containing only 1's and return its area.

Example:

Input:

```
[
  ["1","0","1","0","0"],
  ["1","0","1","1","1"],
  ["1","1","1","1","1"],
  ["1","0","0","1","0"]
]
```

Output: 6"

86. Partition List <https://leetcode.com/problems/partition-list> "Given a linked list and a value x, partition it such that all nodes less than x come before nodes greater than or equal to x.

You should preserve the original relative order of the nodes in each of the two partitions.

Example:

Input: head = 1->4->3->2->5->2, x = 3

Output: 1->2->2->4->3->5"

87. Scramble String <https://leetcode.com/problems/scramble-string> "Given a string s1, we may represent it as a binary tree by partitioning it to two non-empty substrings recursively.

Below is one possible representation of s1 = "great":

```

      great
     /  \
    gr   eat
   / \  / \
  g  r e  at
```

```

  / \
 a  t

```

To scramble the string, we may choose any non-leaf node and swap its two children.

For example, if we choose the node "gr" and swap its two children, it produces a scrambled string "rgeat".

```

  rgeat
 /  \
rg    eat
/  \  /  \
r   g e   at
      \  / \
      a t

```

We say that "rgeat" is a scrambled string of "great".

Similarly, if we continue to swap the children of nodes "eat" and "at", it produces a scrambled string "rgtae".

```

  rgtae
 /  \
rg    tae
/  \  /  \
r   g ta e
      / \
      t a

```

We say that "rgtae" is a scrambled string of "great".

Given two strings s1 and s2 of the same length, determine if s2 is a scrambled string of s1.

Example 1:

Input: s1 = "great", s2 = "rgeat"
Output: true

Example 2:

Input: s1 = "abcde", s2 = "caebd"
Output: false

88. Merge Sorted Array <https://leetcode.com/problems/merge-sorted-array> "Given two sorted integer arrays nums1 and nums2, merge nums2 into nums1 as one sorted array."

Note:

The number of elements initialized in nums1 and nums2 are m and n respectively. You may assume that nums1 has enough space (size that is greater or equal to m + n) to hold additional elements from nums2.

Example:

Input:
nums1 = [1,2,3,0,0,0], m = 3
nums2 = [2,5,6], n = 3

Output: [1,2,2,3,5,6]

89. Gray Code <https://leetcode.com/problems/gray-code> "The gray code is a binary numeral system where two successive values differ in only one bit."

Given a non-negative integer n representing the total number of bits in the code, print the sequence of gray code. A gray code sequence must begin with 0.

For example, given n = 2, return [0,1,3,2]. Its gray code sequence is:

```
00 - 0
01 - 1
11 - 3
10 - 2
```

Note:

For a given n , a gray code sequence is not uniquely defined.

For example, $[0,2,3,1]$ is also a valid gray code sequence according to the above definition.

For now, the judge is able to judge based on one instance of gray code sequence. Sorry about that."

90. Subsets II <https://leetcode.com/problems/subsets-ii> "Given a collection of integers that might contain duplicates, $nums$, return all possible subsets (the power set).

Note: The solution set must not contain duplicate subsets.

Example:

Input: $[1,2,2]$

Output:

```
[
  [2],
  [1],
  [1,2,2],
  [2,2],
  [1,2],
  []
]
```

91. Decode Ways <https://leetcode.com/problems/decode-ways> "A message containing letters from A-Z is being encoded to numbers using the following mapping:

```
'A' -> 1
'B' -> 2
...
'Z' -> 26
```

Given a non-empty string containing only digits, determine the total number of ways to decode it.

Example 1:

Input: "12"

Output: 2

Explanation: It could be decoded as "AB" (1 2) or "L" (12).

Example 2:

Input: "226"

Output: 3

Explanation: It could be decoded as "BZ" (2 26), "VF" (22 6), or "BBF" (2 2 6).

92. Reverse Linked List II <https://leetcode.com/problems/reverse-linked-list-ii> "Reverse a linked list from position m to n . Do it in one-pass.

Note: $1 \leq m \leq n \leq \text{length of list}$.

Example:

Input: 1->2->3->4->5->NULL, $m = 2$, $n = 4$

Output: 1->4->3->2->5->NULL

93. Restore IP Addresses <https://leetcode.com/problems/restore-ip-addresses> "Given a string containing only digits, restore it by returning all possible valid IP address combinations.

Example:

Input: ""25525511135""

Output: [""255.255.11.135"", ""255.255.111.35""]

94. Binary Tree Inorder Traversal <https://leetcode.com/problems/binary-tree-inorder-traversal> "Given a binary tree, return the inorder traversal of its nodes' values."

Example:

Input: [1,null,2,3]

Output: [1,3,2]

Follow up: Recursive solution is trivial, could you do it iteratively?"

95. Unique Binary Search Trees II <https://leetcode.com/problems/unique-binary-search-trees-ii> "Given an integer n, generate all structurally unique BST's (binary search trees) that store values 1 ... n."

Example:

Input: 3

Output:

```
[
  [1,null,3,2],
  [3,2,null,1],
  [3,1,null,null,2],
  [2,1,3],
  [1,null,2,null,3]
]
```

Explanation:

The above output corresponds to the 5 unique BST's shown below:

96. Unique Binary Search Trees <https://leetcode.com/problems/unique-binary-search-trees> "Given n, how many structurally unique BST's (binary search trees) that store values 1 ... n?"

Example:

Input: 3

Output: 5

Explanation:

Given n = 3, there are a total of 5 unique BST's:

97. Interleaving String <https://leetcode.com/problems/interleaving-string> "Given s1, s2, s3, find whether s3 is formed by the interleaving of s1 and s2."

Example 1:

Input: s1 = ""aabcc"", s2 = ""dbbca"", s3 = ""aadbcbcbac""

Output: true

Example 2:

Input: s1 = ""aabcc"", s2 = ""dbbca"", s3 = ""aadbcbcbac""

Output: false

98. Validate Binary Search Tree <https://leetcode.com/problems/validate-binary-search-tree> "Given a binary tree, determine if it is a valid binary search tree (BST)."

Assume a BST is defined as follows:

The left subtree of a node contains only nodes with keys less than the node's key.

The right subtree of a node contains only nodes with keys greater than the node's key.

Both the left and right subtrees must also be binary search trees.

Example 1:

Input:

Output: true

Example 2:

Output: false

Explanation: The input is: [5,1,4,null,null,3,6]. The root node's value is 5 but its right child's value is 4."

99. Recover Binary Search Tree <https://leetcode.com/problems/recover-binary-search-tree> "Two elements of a binary search tree (BST) are swapped by mistake.

Recover the tree without changing its structure.

Example 1:

Input: [1,3,null,null,2]

Output: [3,1,null,null,2]

Example 2:

Input: [3,1,4,null,null,2]

Output: [2,1,4,null,null,3]

Follow up:

A solution using $O(n)$ space is pretty straight forward.

Could you devise a constant space solution?"

100. Same Tree <https://leetcode.com/problems/same-tree> "Given two binary trees, write a function to check if they are the same or not."

Two binary trees are considered the same if they are structurally identical and the nodes have the same value.

Example 1:

Input: $\begin{array}{cc} \begin{array}{c} 1 \\ / \quad \backslash \\ 2 \quad 3 \end{array} & \begin{array}{c} 1 \\ / \quad \backslash \\ 2 \quad 3 \end{array} \\ [1,2,3], & [1,2,3] \end{array}$

Output: true

Example 2:

Input: $\begin{array}{cc} \begin{array}{c} 1 \\ / \\ 2 \end{array} & \begin{array}{c} 1 \\ \backslash \\ 2 \end{array} \\ [1,2], & [1,null,2] \end{array}$

Output: false

Example 3:

Input: $\begin{array}{cc} \begin{array}{c} 1 \\ / \quad \backslash \\ 2 \quad 1 \end{array} & \begin{array}{c} 1 \\ / \quad \backslash \\ 1 \quad 2 \end{array} \\ [1,2,1], & [1,1,2] \end{array}$

Output: false"

101. Symmetric Tree <https://leetcode.com/problems/symmetric-tree> "Given a binary tree, check whether it is a mirror of itself (ie, symmetric around its center)."

For example, this binary tree [1,2,2,3,4,4,3] is symmetric:

$\begin{array}{c} 1 \\ / \quad \backslash \\ 2 \quad 2 \\ / \quad \backslash \quad / \quad \backslash \\ 3 \quad 4 \quad 4 \quad 3 \end{array}$

But the following [1,2,2,null,3,null,3] is not:

$\begin{array}{c} 1 \\ / \quad \backslash \\ 2 \quad 2 \\ \backslash \quad \backslash \\ 3 \quad 3 \end{array}$

Note:

Bonus points if you could solve it both recursively and iteratively."

102. Binary Tree Level Order Traversal <https://leetcode.com/problems/binary-tree-level-order-traversal> "Given a binary tree, return the level order traversal of its nodes' values. (ie, from left to right, level by level)."

For example:

Given binary tree [3,9,20,null,null,15,7],

return its level order traversal as:

```
[
  [3],
  [9,20],
  [15,7]
]
```

103. Binary Tree Zigzag Level Order Traversal <https://leetcode.com/problems/binary-tree-zigzag-level-order-traversal> "Given a binary tree, return the zigzag level order traversal of its nodes' values. (ie, from left to right, then right to left for the next level and alternate between)."

For example:

Given binary tree [3,9,20,null,null,15,7],

return its zigzag level order traversal as:

```
[
  [3],
  [20,9],
  [15,7]
]
```

104. Maximum Depth of Binary Tree <https://leetcode.com/problems/maximum-depth-of-binary-tree> "Given a binary tree, find its maximum depth."

The maximum depth is the number of nodes along the longest path from the root node down to the farthest leaf node.

Note: A leaf is a node with no children.

Example:

Given binary tree [3,9,20,null,null,15,7],

return its depth = 3."

105. Construct Binary Tree from Preorder and Inorder Traversal <https://leetcode.com/problems/construct-binary-tree-from-preorder-and-inorder-traversal> "Given preorder and inorder traversal of a tree, construct the binary tree."

Note:

You may assume that duplicates do not exist in the tree.

For example, given

```
preorder = [3,9,20,15,7]
inorder = [9,3,15,20,7]
```

Return the following binary tree:

106. Construct Binary Tree from Inorder and Postorder Traversal <https://leetcode.com/problems/construct-binary-tree-from-inorder-and-postorder-traversal> "Given inorder and postorder traversal of a tree, construct the binary tree."

Note:

You may assume that duplicates do not exist in the tree.

For example, given

```
inorder = [9,3,15,20,7]
postorder = [9,15,7,20,3]
```

Return the following binary tree:

107. Binary Tree Level Order Traversal II <https://leetcode.com/problems/binary-tree-level-order-traversal-ii> "Given a binary tree, return the bottom-up level order traversal of its nodes' values. (ie, from left to right, level by level from leaf to root)."

For example:

Given binary tree [3,9,20,null,null,15,7],

return its bottom-up level order traversal as:

```
[
  [15,7],
  [9,20],
  [3]
]"
```

108. Convert Sorted Array to Binary Search Tree <https://leetcode.com/problems/convert-sorted-array-to-binary-search-tree> "Given an array where elements are sorted in ascending order, convert it to a height balanced BST."

For this problem, a height-balanced binary tree is defined as a binary tree in which the depth of the two subtrees of every node never differ by more than 1.

Example:

Given the sorted array: [-10,-3,0,5,9],

One possible answer is: [0,-3,9,-10,null,5], which represents the following height balanced BST:

```
-10 5"};
```

109. Convert Sorted List to Binary Search Tree <https://leetcode.com/problems/convert-sorted-list-to-binary-search-tree> "Given a singly linked list where elements are sorted in ascending order, convert it to a height balanced BST."

For this problem, a height-balanced binary tree is defined as a binary tree in which the depth of the two subtrees of every node never differ by more than 1.

Example:

Given the sorted linked list: [-10,-3,0,5,9],

One possible answer is: [0,-3,9,-10,null,5], which represents the following height balanced BST:

110. Balanced Binary Tree <https://leetcode.com/problems/balanced-binary-tree> "Given a binary tree, determine if it is height-balanced."

For this problem, a height-balanced binary tree is defined as:

a binary tree in which the depth of the two subtrees of every node never differ by more than 1.

Example 1:

Given the following tree [3,9,20,null,null,15,7]:

Return true.

Example 2:

Given the following tree [1,2,2,3,3,null,null,4,4]:

Return false."

111. Minimum Depth of Binary Tree <https://leetcode.com/problems/minimum-depth-of-binary-tree> "Given a binary tree, find its minimum depth."

The minimum depth is the number of nodes along the shortest path from the root node down to the nearest leaf node.

Note: A leaf is a node with no children.

Example:

Given binary tree [3,9,20,null,null,15,7],

```

    /  \
   15   7

```

return its minimum depth = 2."?

112. Path Sum <https://leetcode.com/problems/path-sum> "Given a binary tree and a sum, determine if the tree has a root-to-leaf path such that adding up all the values along the path equals the given sum.

Note: A leaf is a node with no children.

Example:

Given the below binary tree and sum = 22,

```

      5
     / \
    4   8
   / \ / \
  11 13 4
 / \   \
7  2   1

```

return true, as there exist a root-to-leaf path 5->4->11->2 which sum is 22."?

113. Path Sum II <https://leetcode.com/problems/path-sum-ii> "Given a binary tree and a sum, find all root-to-leaf paths where each path's sum equals the given sum.

Note: A leaf is a node with no children.

Example:

Given the below binary tree and sum = 22,

```

      5
     / \
    4   8
   / \ / \
  11 13 4
 / \   \
7  2   5  1

```

Return:

```

[
  [5,4,11,2],
  [5,8,4,5]
]

```

114. Flatten Binary Tree to Linked List <https://leetcode.com/problems/flatten-binary-tree-to-linked-list> "Given a binary tree, flatten it to a linked list in-place.

For example, given the following tree:

```

      1
     / \
    2   5
   / \   \
  3  4   6

```

The flattened tree should look like:

```

  1
   \
    2
     \
      3
       \
        4
         \
          5
           \
            6

```

115. Distinct Subsequences <https://leetcode.com/problems/distinct-subsequences> "Given a string S and a string T, count the number of distinct subsequences of S which equals T."

A subsequence of a string is a new string which is formed from the original string by deleting some (can be none) of the characters without disturbing the relative positions of the remaining characters. (ie, "ACE" is a subsequence of "ABCDE" while "AEC" is not).

Example 1:

Input: S = "rabbbit", T = "rabbit"

Output: 3

Explanation:

As shown below, there are 3 ways you can generate "rabbit" from S.
(The caret symbol ^ means the chosen letters)

```
rabbbit
^ ^ ^ ^ ^
rabbbit
^ ^ ^ ^ ^
rabbbit
^ ^ ^ ^ ^
```

Example 2:

Input: S = "babgbag", T = "bag"

Output: 5

Explanation:

As shown below, there are 5 ways you can generate "bag" from S.
(The caret symbol ^ means the chosen letters)

```
babgbag
^ ^ ^
babgbag
^ ^ ^
babgbag
^ ^ ^
babgbag
^ ^ ^
babgbag
^ ^ ^
```

116. Populating Next Right Pointers in Each Node <https://leetcode.com/problems/populating-next-right-pointers-in-each-node> "Given a binary tree

```
struct TreeLinkNode {
    TreeLinkNode *left;
    TreeLinkNode *right;
    TreeLinkNode *next;
}
```

Populate each next pointer to point to its next right node. If there is no next right node, the next pointer should be set to NULL.

Initially, all next pointers are set to NULL.

Note:

You may only use constant extra space.

Recursive approach is fine, implicit stack space does not count as extra space for this problem.

You may assume that it is a perfect binary tree (ie, all leaves are at the same level, and every parent has two children).

Example:

Given the following perfect binary tree,

After calling your function, the tree should look like:

```

      1 -> NULL
     / \
    2 -> 3 -> NULL
   /\  /\
  4->5->6->7 -> NULL";
117. Populating Next Right Pointers in Each Node II https://leetcode.com/problems/populating-next-right-pointers-in-each-node-ii "Given a binary tree

```

```

struct TreeLinkNode {
    TreeLinkNode *left;
    TreeLinkNode *right;
    TreeLinkNode *next;
}

```

Populate each next pointer to point to its next right node. If there is no next right node, the next pointer should be set to NULL.

Initially, all next pointers are set to NULL.

Note:

You may only use constant extra space.

Recursive approach is fine, implicit stack space does not count as extra space for this problem.

Example:

Given the following binary tree,

After calling your function, the tree should look like:

```

      1 -> NULL
     / \
    2 -> 3 -> NULL
   /\  /\
  4-> 5 -> 7 -> NULL";
118. Pascal's Triangle https://leetcode.com/problems/pascals-triangle "Given a non-negative integer numRows, generate the first numRows of Pascal's triangle.

```

In Pascal's triangle, each number is the sum of the two numbers directly above it.

Example:

Input: 5

Output:

```

[
  [1],
  [1,1],
  [1,2,1],
  [1,3,3,1],
  [1,4,6,4,1]
]

```

```
]"&
119. Pascal's Triangle II https://leetcode.com/problems/pascals-triangle-ii "Given a non-negative index k where k ≤ 33, return the kth index row of the Pascal's triangle.
```

Note that the row index starts from 0.

In Pascal's triangle, each number is the sum of the two numbers directly above it.

Example:

```
Input: 3
Output: [1,3,3,1]
```

Follow up:

```
Could you optimize your algorithm to use only O(k) extra space?"&
120. Triangle https://leetcode.com/problems/triangle "Given a triangle, find the minimum path sum from top to bottom. Each step you may move to adjacent numbers on the row below.
```

For example, given the following triangle

```
[
  [2],
  [3,4],
  [6,5,7],
  [4,1,8,3]
]
```

The minimum path sum from top to bottom is 11 (i.e., 2 + 3 + 5 + 1 = 11).

Note:

```
Bonus point if you are able to do this using only O(n) extra space, where n is the total number of rows in the triangle."&
```

```
121. Best Time to Buy and Sell Stock https://leetcode.com/problems/best-time-to-buy-and-sell-stock "Say you have an array for which the ith element is the price of a given stock on day i.
```

If you were only permitted to complete at most one transaction (i.e., buy one and sell one share of the stock), design an algorithm to find the maximum profit.

Note that you cannot sell a stock before you buy one.

Example 1:

```
Input: [7,1,5,3,6,4]
Output: 5
Explanation: Buy on day 2 (price = 1) and sell on day 5 (price = 6), profit = 6-1 = 5.
           Not 7-1 = 6, as selling price needs to be larger than buying price.
```

Example 2:

```
Input: [7,6,4,3,1]
Output: 0
Explanation: In this case, no transaction is done, i.e. max profit = 0."&
122. Best Time to Buy and Sell Stock II https://leetcode.com/problems/best-time-to-buy-and-sell-stock-ii "Say you have an array for which the ith element is the price of a given stock on day i.
```

Design an algorithm to find the maximum profit. You may complete as many transactions as you like (i.e., buy one and sell one share of the stock multiple times).

Note: You may not engage in multiple transactions at the same time (i.e., you must sell the stock before you buy again).

Example 1:

Input: [7,1,5,3,6,4]

Output: 7

Explanation: Buy on day 2 (price = 1) and sell on day 3 (price = 5), profit = $5 - 1 = 4$.

Then buy on day 4 (price = 3) and sell on day 5 (price = 6), profit = $6 - 3 = 3$.

Example 2:

Input: [1,2,3,4,5]

Output: 4

Explanation: Buy on day 1 (price = 1) and sell on day 5 (price = 5), profit = $5 - 1 = 4$.

Note that you cannot buy on day 1, buy on day 2 and sell them later, as you are engaging multiple transactions at the same time. You must sell before buying again.

Example 3:

Input: [7,6,4,3,1]

Output: 0

Explanation: In this case, no transaction is done, i.e. max profit = 0."

123. Best Time to Buy and Sell Stock III <https://leetcode.com/problems/best-time-to-buy-and-sell-stock-iii> "Say you have an array for which the i th element is the price of a given stock on day i .

Design an algorithm to find the maximum profit. You may complete at most two transactions.

Note: You may not engage in multiple transactions at the same time (i.e., you must sell the stock before you buy again).

Example 1:

Input: [3,3,5,0,0,3,1,4]

Output: 6

Explanation: Buy on day 4 (price = 0) and sell on day 6 (price = 3), profit = $3 - 0 = 3$.

Then buy on day 7 (price = 1) and sell on day 8 (price = 4), profit = $4 - 1 = 3$.

Example 2:

Input: [1,2,3,4,5]

Output: 4

Explanation: Buy on day 1 (price = 1) and sell on day 5 (price = 5), profit = $5 - 1 = 4$.

Note that you cannot buy on day 1, buy on day 2 and sell them later, as you are engaging multiple transactions at the same time. You must sell before buying again.

Example 3:

Input: [7,6,4,3,1]

Output: 0

Explanation: In this case, no transaction is done, i.e. max profit = 0."

124. Binary Tree Maximum Path Sum <https://leetcode.com/problems/binary-tree-maximum-path-sum> "Given a non-empty binary tree, find the maximum path sum.

For this problem, a path is defined as any sequence of nodes from some starting node to any node in the tree along the parent-child connections. The path must contain at least one node and does not need to go through the root.

Example 1:

Input: [1,2,3]

Output: 6

Example 2:

Input: [-10,9,20,null,null,15,7]

Output: 42"

125. Valid Palindrome <https://leetcode.com/problems/valid-palindrome> "Given a string, determine if it is a palindrome, considering only alphanumeric characters and ignoring cases.

Note: For the purpose of this problem, we define empty string as valid palindrome.

Example 1:

Input: "A man, a plan, a canal: Panama"

Output: true

Example 2:

Input: "race a car"

Output: false"

126. Word Ladder II <https://leetcode.com/problems/word-ladder-ii> "Given two words (beginWord and endWord), and a dictionary's word list, find all shortest transformation sequence(s) from beginWord to endWord, such that:

Only one letter can be changed at a time

Each transformed word must exist in the word list. Note that beginWord is not a transformed word.

Note:

Return an empty list if there is no such transformation sequence.

All words have the same length.

All words contain only lowercase alphabetic characters.

You may assume no duplicates in the word list.

You may assume beginWord and endWord are non-empty and are not the same.

Example 1:

Input:

beginWord = "hit",

endWord = "cog",

wordList = ["hot","dot","dog","lot","log","cog"]

Output:

```
[
  ["hit","hot","dot","dog","cog"],
  ["hit","hot","lot","log","cog"]
]
```

Example 2:

Input:

beginWord = "hit"

```
endWord = "cog"
wordList = ["hot","dot","dog","lot","log"]
```

Output: []

Explanation: The endWord "cog" is not in wordList, therefore no possible transformation."

127. Word Ladder <https://leetcode.com/problems/word-ladder> "Given two words (beginWord and endWord), and a dictionary's word list, find the length of shortest transformation sequence from beginWord to endWord, such that:

Only one letter can be changed at a time.

Each transformed word must exist in the word list. Note that beginWord is not a transformed word.

Note:

Return 0 if there is no such transformation sequence.

All words have the same length.

All words contain only lowercase alphabetic characters.

You may assume no duplicates in the word list.

You may assume beginWord and endWord are non-empty and are not the same.

Example 1:

Input:

```
beginWord = "hit",
endWord = "cog",
wordList = ["hot","dot","dog","lot","log","cog"]
```

Output: 5

Explanation: As one shortest transformation is "hit" -> "hot" -> "dot" -> "dog" -> "cog", return its length 5.

Example 2:

Input:

```
beginWord = "hit"
endWord = "cog"
wordList = ["hot","dot","dog","lot","log"]
```

Output: 0

Explanation: The endWord "cog" is not in wordList, therefore no possible transformation."

128. Longest Consecutive Sequence <https://leetcode.com/problems/longest-consecutive-sequence> "Given an unsorted array of integers, find the length of the longest consecutive elements sequence.

Your algorithm should run in O(n) complexity.

Example:

Input: [100, 4, 200, 1, 3, 2]

Output: 4

Explanation: The longest consecutive elements sequence is [1, 2, 3, 4]. Therefore its length is 4."

129. Sum Root to Leaf Numbers <https://leetcode.com/problems/sum-root-to-leaf-numbers> "Given a binary tree containing digits from 0-9 only, each root-to-leaf path could represent a number.

An example is the root-to-leaf path 1->2->3 which represents the number 123.

Find the total sum of all root-to-leaf numbers.

Note: A leaf is a node with no children.

Example:

Input: [1,2,3]

```

  1
 / \
2   3

```

Output: 25

Explanation:

The root-to-leaf path 1->2 represents the number 12.

The root-to-leaf path 1->3 represents the number 13.

Therefore, sum = 12 + 13 = 25.

Example 2:

Input: [4,9,0,5,1]

```

  4
 / \
9   0
 / \
5   1

```

Output: 1026

Explanation:

The root-to-leaf path 4->9->5 represents the number 495.

The root-to-leaf path 4->9->1 represents the number 491.

The root-to-leaf path 4->0 represents the number 40.

Therefore, sum = 495 + 491 + 40 = 1026."

130. Surrounded Regions <https://leetcode.com/problems/surrounded-regions> "Given a 2D board containing 'X' and 'O' (the letter O), capture all regions surrounded by 'X'.

A region is captured by flipping all 'O's into 'X's in that surrounded region.

Example:

```

X X X X
X O O X
X X O X
X O X X

```

After running your function, the board should be:

```

X X X X
X X X X
X X X X
X O X X

```

Explanation:

Surrounded regions shouldn't be on the border, which means that any 'O' on the border of the board are not flipped to 'X'. Any 'O' that is not on the border and it is not connected to an 'O' on the border will be flipped to 'X'. Two cells are connected if they are adjacent cells connected horizontally or vertically."

131. Palindrome Partitioning <https://leetcode.com/problems/palindrome-partitioning> "Given a string s, partition s such that every substring of the partition is a palindrome.

Return all possible palindrome partitioning of s.

Example:

Input: "aab"

Output:

```

[
  ["aa","b"],
  ["a","a","b"]
]
```

132. Palindrome Partitioning II <https://leetcode.com/problems/palindrome-partitioning-ii> "Given a string s, partition s such that every substring of the partition is a palindrome.

Return the minimum cuts needed for a palindrome partitioning of s.

Example:

Input: "aab"

Output: 1

Explanation: The palindrome partitioning ["aa","b"] could be produced using 1 cut.

133. Clone Graph <https://leetcode.com/problems/clone-graph> "OJ's undirected graph serialization:

Nodes are labeled uniquely.

We use # as a separator for each node, and , as a separator for node label and each neighbor of the node.

As an example, consider the serialized graph {0,1,2#1,2#2,2}.

The graph has a total of three nodes, and therefore contains three parts as separated by #.

First node is labeled as 0. Connect node 0 to both nodes 1 and 2.

Second node is labeled as 1. Connect node 1 to node 2.

Third node is labeled as 2. Connect node 2 to node 2 (itself), thus forming a self-cycle.

Visually, the graph looks like the following:

133. Clone Graph <https://leetcode.com/problems/clone-graph> "Clone an undirected graph. Each node in the graph contains a label and a list of its neighbors.

OJ's undirected graph serialization:

Nodes are labeled uniquely.

We use # as a separator for each node, and , as a separator for node label and each neighbor of the node.

As an example, consider the serialized graph {0,1,2#1,2#2,2}.

The graph has a total of three nodes, and therefore contains three parts as separated by #.

First node is labeled as 0. Connect node 0 to both nodes 1 and 2.

Second node is labeled as 1. Connect node 1 to node 2.

Third node is labeled as 2. Connect node 2 to node 2 (itself), thus forming a self-cycle.

Visually, the graph looks like the following:

134. Gas Station <https://leetcode.com/problems/gas-station> "There are N gas stations along a circular route, where the amount of gas at station i is gas[i].

You have a car with an unlimited gas tank and it costs cost[i] of gas to travel from station i to its next station (i+1). You begin the journey with an empty tank at one of the gas stations.

Return the starting gas station's index if you can travel around the circuit once in the clockwise direction, otherwise return -1.

Note:

If there exists a solution, it is guaranteed to be unique.
Both input arrays are non-empty and have the same length.
Each element in the input arrays is a non-negative integer.

Example 1:

Input:

```
gas = [1,2,3,4,5]
cost = [3,4,5,1,2]
```

Output: 3

Explanation:

Start at station 3 (index 3) and fill up with 4 unit of gas. Your tank = 0 + 4 = 4
Travel to station 4. Your tank = 4 - 1 + 5 = 8
Travel to station 0. Your tank = 8 - 2 + 1 = 7
Travel to station 1. Your tank = 7 - 3 + 2 = 6
Travel to station 2. Your tank = 6 - 4 + 3 = 5
Travel to station 3. The cost is 5. Your gas is just enough to travel back to station 3.
Therefore, return 3 as the starting index.

Example 2:

Input:

```
gas = [2,3,4]
cost = [3,4,3]
```

Output: -1

Explanation:

You can't start at station 0 or 1, as there is not enough gas to travel to the next station.

Let's start at station 2 and fill up with 4 unit of gas. Your tank = 0 + 4 = 4

Travel to station 0. Your tank = 4 - 3 + 2 = 3

Travel to station 1. Your tank = 3 - 3 + 3 = 3

You cannot travel back to station 2, as it requires 4 unit of gas but you only have 3.

Therefore, you can't travel around the circuit once no matter where you start."

135. Candy <https://leetcode.com/problems/candy> "There are N children standing in a line. Each child is assigned a rating value.

You are giving candies to these children subjected to the following requirements:

Each child must have at least one candy.
Children with a higher rating get more candies than their neighbors.

What is the minimum candies you must give?

Example 1:

Input: [1,0,2]

Output: 5

Explanation: You can allocate to the first, second and third child with 2, 1, 2 candies respectively.

Example 2:

Input: [1,2,2]

Output: 4

Explanation: You can allocate to the first, second and third child with 1, 2, 1 candies respectively.

The third child gets 1 candy because it satisfies the above two conditions."

136. Single Number <https://leetcode.com/problems/single-number> "Given a non-empty array of integers, every element appears twice except for one. Find that single one.

Note:

Your algorithm should have a linear runtime complexity. Could you implement it without using extra memory?

Example 1:

Input: [2,2,1]

Output: 1

Example 2:

Input: [4,1,2,1,2]

Output: 4"

137. Single Number II <https://leetcode.com/problems/single-number-ii> "Given a non-empty array of integers, every element appears three times except for one, which appears exactly once. Find that single one.

Note:

Your algorithm should have a linear runtime complexity. Could you implement it without using extra memory?

Example 1:

Input: [2,2,3,2]

Output: 3

Example 2:

Input: [0,1,0,1,0,1,99]

Output: 99"

138. Copy List with Random Pointer <https://leetcode.com/problems/copy-list-with-random-pointer> "A linked list is given such that each node contains an additional random pointer which could point to any node in the list or null.

Return a deep copy of the list."

139. Word Break <https://leetcode.com/problems/word-break> "Given a non-empty string s and a dictionary wordDict containing a list of non-empty words, determine if s can be segmented into a space-separated sequence of one or more dictionary words.

Note:

The same word in the dictionary may be reused multiple times in the segmentation

.

You may assume the dictionary does not contain duplicate words.

Example 1:

Input: s = "leetcode", wordDict = ["leet", "code"]

Output: true

Explanation: Return true because "leetcode" can be segmented as "leet code".

Example 2:

Input: s = "applepenapple", wordDict = ["apple", "pen"]

Output: true

Explanation: Return true because "applepenapple" can be segmented as "apple pen apple".

Note that you are allowed to reuse a dictionary word.

Example 3:

Input: s = "catsanddog", wordDict = ["cats", "dog", "sand", "and", "cat"]

Output: false

140. Word Break II <https://leetcode.com/problems/word-break-ii> "Given a non-empty string s and a dictionary wordDict containing a list of non-empty words, add spaces in s to construct a sentence where each word is a valid dictionary word. Return all such possible sentences."

Note:

The same word in the dictionary may be reused multiple times in the segmentation.

You may assume the dictionary does not contain duplicate words.

Example 1:

Input:

s = "catsanddog"

wordDict = ["cat", "cats", "and", "sand", "dog"]

Output:

```
[
  "cats and dog",
  "cat sand dog"
]
```

Example 2:

Input:

s = "pineapplepenapple"

wordDict = ["apple", "pen", "applepen", "pine", "pineapple"]

Output:

```
[
  "pine apple pen apple",
  "pineapple pen apple",
  "pine applepen apple"
]
```

Explanation: Note that you are allowed to reuse a dictionary word.

Example 3:

Input:

s = "catsanddog"

wordDict = ["cats", "dog", "sand", "and", "cat"]

Output:

[]

141. Linked List Cycle <https://leetcode.com/problems/linked-list-cycle> "Given a linked list, determine if it has a cycle in it."

Follow up:

Can you solve it without using extra space?"

142. Linked List Cycle II <https://leetcode.com/problems/linked-list-cycle-ii> "Given a linked list, return the node where the cycle begins. If there is no cycle, return null.

Note: Do not modify the linked list.

Follow up:

Can you solve it without using extra space?"

143. Reorder List <https://leetcode.com/problems/reorder-list> "Given a singly linked list L: L₀→L₁→...→L_{n-1}→L_n,

reorder it to: L₀→L_n→L₁→L_{n-1}→L₂→L_{n-2}→...

You may not modify the values in the list's nodes, only nodes itself may be changed.

Example 1:

Given 1→2→3→4, reorder it to 1→4→2→3.

Example 2:

Given 1→2→3→4→5, reorder it to 1→5→2→4→3."

144. Binary Tree Preorder Traversal <https://leetcode.com/problems/binary-tree-preorder-traversal> "Given a binary tree, return the preorder traversal of its nodes' values.

Example:

Input: [1,null,2,3]

Output: [1,2,3]

Follow up: Recursive solution is trivial, could you do it iteratively?"

145. Binary Tree Postorder Traversal <https://leetcode.com/problems/binary-tree-postorder-traversal> "Given a binary tree, return the postorder traversal of its nodes' values.

Example:

Input: [1,null,2,3]

Output: [3,2,1]

Follow up: Recursive solution is trivial, could you do it iteratively?"

146. LRU Cache <https://leetcode.com/problems/lru-cache> "Design and implement a data structure for Least Recently Used (LRU) cache. It should support the following operations: get and put.

get(key) - Get the value (will always be positive) of the key if the key exists in the cache, otherwise return -1.

put(key, value) - Set or insert the value if the key is not already present. When the cache reached its capacity, it should invalidate the least recently used item before inserting a new item.

Follow up:

Could you do both operations in $O(1)$ time complexity?

Example:

```
LRUCache cache = new LRUCache( 2 /* capacity */ );

cache.put(1, 1);
cache.put(2, 2);
cache.get(1);    // returns 1
cache.put(3, 3);  // evicts key 2
cache.get(2);    // returns -1 (not found)
cache.put(4, 4);  // evicts key 1
cache.get(1);    // returns -1 (not found)
cache.get(3);    // returns 3
cache.get(4);    // returns 4"
```

147. Insertion Sort List <https://leetcode.com/problems/insertion-sort-list> "Sort a linked list using insertion sort."

A graphical example of insertion sort. The partial sorted list (black) initially contains only the first element in the list.

With each iteration one element (red) is removed from the input data and inserted in-place into the sorted list

Algorithm of Insertion Sort:

Insertion sort iterates, consuming one input element each repetition, and growing a sorted output list.

At each iteration, insertion sort removes one element from the input data, finds the location it belongs within the sorted list, and inserts it there.

It repeats until no input elements remain.

Example 1:

Input: 4->2->1->3
Output: 1->2->3->4

Example 2:

Input: -1->5->3->4->0
Output: -1->0->3->4->5"

148. Sort List <https://leetcode.com/problems/sort-list> "Sort a linked list in $O(n \log n)$ time using constant space complexity."

Example 1:

Input: 4->2->1->3
Output: 1->2->3->4

Example 2:

Input: -1->5->3->4->0

Output: -1->0->3->4->5"

149. Max Points on a Line <https://leetcode.com/problems/max-points-on-a-line> "Given n points on a 2D plane, find the maximum number of points that lie on the same straight line."

Example 1:

Input: [[1,1],[2,2],[3,3]]

Output: 3

Explanation:

Example 2:

Input: [[1,1],[3,2],[5,3],[4,1],[2,3],[1,4]]

Output: 4

Explanation:

150. Evaluate Reverse Polish Notation <https://leetcode.com/problems/evaluate-reverse-polish-notation> "Evaluate the value of an arithmetic expression in Reverse Polish Notation."

Valid operators are +, -, *, /. Each operand may be an integer or another expression.

Note:

Division between two integers should truncate toward zero.

The given RPN expression is always valid. That means the expression would always evaluate to a result and there won't be any divide by zero operation.

Example 1:

Input: ["2", "1", "+", "3", "*"]

Output: 9

Explanation: $((2 + 1) * 3) = 9$

Example 2:

Input: ["4", "13", "5", "/", "+"]

Output: 6

Explanation: $(4 + (13 / 5)) = 6$

Example 3:

Input: ["10", "6", "9", "3", "+", "-11", "*", "/", "*", "17", "+", "5", "+"]

Output: 22

Explanation:

$((10 * (6 / ((9 + 3) * -11))) + 17) + 5$
 $= ((10 * (6 / (12 * -11))) + 17) + 5$
 $= ((10 * (6 / -132)) + 17) + 5$
 $= ((10 * 0) + 17) + 5$
 $= (0 + 17) + 5$

= 17 + 5
= 22"

151. Reverse Words in a String <https://leetcode.com/problems/reverse-words-in-a-string> "Given an input string, reverse the string word by word."

Example:

Input: "the sky is blue",
Output: "blue is sky the".

Notes:

A word is defined as a sequence of non-space characters.

Input string may contain leading or trailing spaces. However, your reversed string should not contain leading or trailing spaces.

You need to reduce multiple spaces between two words to a single space in the reversed string.

Follow up: For C programmers, try to solve it in-place in $O(1)$ space."

152. Maximum Product Subarray <https://leetcode.com/problems/maximum-product-subarray> "Given an integer array nums, find the contiguous subarray within an array (containing at least one number) which has the largest product."

Example 1:

Input: [2,3,-2,4]
Output: 6
Explanation: [2,3] has the largest product = 6.

Example 2:

Input: [-2,0,-1]
Output: 0
Explanation: The result cannot be 2, because [-2,-1] is not a subarray."
153. Find Minimum in Rotated Sorted Array <https://leetcode.com/problems/find-minimum-in-rotated-sorted-array> "Suppose an array sorted in ascending order is rotated at some pivot unknown to you beforehand.

(i.e., [0,1,2,4,5,6,7] might become [4,5,6,7,0,1,2]).

Find the minimum element.

You may assume no duplicate exists in the array.

Example:

Input: [3,4,5,1,2]
Output: 1"

154. Find Minimum in Rotated Sorted Array II <https://leetcode.com/problems/find-minimum-in-rotated-sorted-array-ii> "Suppose an array sorted in ascending order is rotated at some pivot unknown to you beforehand.

(i.e., [0,1,2,4,5,6,7] might become [4,5,6,7,0,1,2]).

Find the minimum element.

The array may contain duplicates.

Example 1:

Input: [1,3,5]
Output: 1

Example 2:

Input: [2,2,2,0,1]
Output: 0

Note:

This is a follow up for "Find Minimum in Rotated Sorted Array".

Would allow duplicates affect the run-time complexity? How and why?"
 155. Min Stack <https://leetcode.com/problems/min-stack> "Design a stack that supports push, pop, top, and retrieving the minimum element in constant time."

push(x) -- Push element x onto stack.

pop() -- Removes the element on top of the stack.

top() -- Get the top element.

getMin() -- Retrieve the minimum element in the stack.

Example:

```
MinStack minStack = new MinStack();
minStack.push(-2);
minStack.push(0);
minStack.push(-3);
minStack.getMin(); --> Returns -3.
minStack.pop();
minStack.top(); --> Returns 0.
minStack.getMin(); --> Returns -2."
```

160. Intersection of Two Linked Lists <https://leetcode.com/problems/intersection-of-two-linked-lists> "Write a program to find the node at which the intersection of two singly linked lists begins."

For example, the following two linked lists:

```
A:      a1 -> a2
              |
              c1 -> c2 -> c3
              |
B:      b1 -> b2 -> b3
```

begin to intersect at node c1.

Notes:

If the two linked lists have no intersection at all, return null.
 The linked lists must retain their original structure after the function returns.
 You may assume there are no cycles anywhere in the entire linked structure.
 Your code should preferably run in O(n) time and use only O(1) memory.

Credits:

Special thanks to @stellari for adding this problem and creating all test cases."
 162. Find Peak Element <https://leetcode.com/problems/find-peak-element> "A peak element is an element that is greater than its neighbors."

Given an input array nums, where num[i] < num[i+1], find a peak element and return its index.

The array may contain multiple peaks, in that case return the index to any one of the peaks is fine.

You may imagine that num[-1] = num[n] = -∞.

Example 1:

```
Input: nums = [1, 2, 3, 1]
Output: 2
```

Explanation: 3 is a peak element and your function should return the index number 2.

Example 2:

Input: nums = [1, 2, 1, 3, 5, 6, 4]

Output: 1 or 5

Explanation: Your function can return either index number 1 where the peak element is 2,
or index number 5 where the peak element is 6.

Note:

Your solution should be in logarithmic complexity.

Credits:

Special thanks to @ts for adding this problem and creating all test cases."?
162. Find Peak Element <https://leetcode.com/problems/find-peak-element> "Note:

Your solution should be in logarithmic complexity."?
164. Maximum Gap <https://leetcode.com/problems/maximum-gap> "Given an unsorted array, find the maximum difference between the successive elements in its sorted form .

Return 0 if the array contains less than 2 elements.

Example 1:

Input: [3,9,6,1]

Output: 3

Explanation: The sorted form of the array is [1,3,6,9], either 3,6 or 6,9 has the maximum difference 3.

Example 2:

Input: [10]

Output: 0

Explanation: The array contains less than 2 elements, therefore return 0.

Notes:

You may assume all elements in the array are non-negative integers and fit in the 32-bit signed integer range.

Try to solve it in linear time/space.

Credits:

Special thanks to @porker2008 for adding this problem and creating all test cases."?
165. Compare Version Numbers <https://leetcode.com/problems/compare-version-numbers> "Compare two version numbers version1 and version2.

If version1 > version2 return 1, if version1 < version2 return -1, otherwise return 0.

You may assume that the version strings are non-empty and contain only digits and the . character.

The . character does not represent a decimal point and is used to separate number sequences.

For instance, 2.5 is not "two and a half" or "half way to version three", it is the fifth second-level revision of the second first-level revision.

Here is an example of version numbers ordering:

0.1 < 1.1 < 1.2 < 13.37

Special thanks to @ts for adding this problem and creating all test cases."&
 166. Fraction to Recurring Decimal <https://leetcode.com/problems/fraction-to-recurring-decimal> "Given two integers representing the numerator and denominator of a fraction, return the fraction in string format.

If the fractional part is repeating, enclose the repeating part in parentheses.

Example 1:

Input: numerator = 1, denominator = 2
 Output: "0.5".

Example 2:

Input: numerator = 2, denominator = 1
 Output: "2".

Example 3:

Input: numerator = 2, denominator = 3
 Output: "0.(6)".

Credits:

Special thanks to @Shangrila for adding this problem and creating all test cases."&
 167. Two Sum II - Input array is sorted <https://leetcode.com/problems/two-sum-ii-input-array-is-sorted> "Given an array of integers that is already sorted in ascending order, find two numbers such that they add up to a specific target number.

The function twoSum should return indices of the two numbers such that they add up to the target, where index1 must be less than index2.

Note:

Your returned answers (both index1 and index2) are not zero-based.

You may assume that each input would have exactly one solution and you may not use the same element twice.

Example:

Input: numbers = [2, 7, 11, 15], target = 9

Output: [1,2]

Explanation: The sum of 2 and 7 is 9. Therefore index1 = 1, index2 = 2."&

168. Excel Sheet Column Title <https://leetcode.com/problems/excel-sheet-column-title> "Given a positive integer, return its corresponding column title as appear in an Excel sheet.

For example:

```
1 -> A
2 -> B
3 -> C
...
26 -> Z
27 -> AA
28 -> AB
...
```

Example 1:

Input: 1
 Output: "A"

Example 2:

Input: 28
 Output: "AB"

Example 3:

Input: 701
Output: ""ZY""

Credits:

Special thanks to @ifanchu for adding this problem and creating all test cases."©. Majority Element <https://leetcode.com/problems/majority-element> "Given an array of size n , find the majority element. The majority element is the element that appears more than $\lfloor n/2 \rfloor$ times.

You may assume that the array is non-empty and the majority element always exist in the array.

Example 1:

Input: [3,2,3]
Output: 3

Example 2:

Input: [2,2,1,1,1,2,2]
Output: 2

Credits:

Special thanks to @ts for adding this problem and creating all test cases."«. Excel Sheet Column Number <https://leetcode.com/problems/excel-sheet-column-number> "Given a column title as appear in an Excel sheet, return its corresponding column number.

For example:

```
A -> 1
B -> 2
C -> 3
...
Z -> 26
AA -> 27
AB -> 28
...
```

Example 1:

Input: "A"
Output: 1

Example 2:

Input: "AB"
Output: 28

Example 3:

Input: ""ZY""
Output: 701

Credits:

Special thanks to @ts for adding this problem and creating all test cases."¬. Factorial Trailing Zeroes <https://leetcode.com/problems/factorial-trailing-zeroes> "Given an integer n , return the number of trailing zeroes in $n!$.

Example 1:

Input: 3
Output: 0
Explanation: $3! = 6$, no trailing zero.

Example 2:

Input: 5

Output: 1

Explanation: $5! = 120$, one trailing zero.

Note: Your solution should be in logarithmic time complexity.

Credits:

Special thanks to @ts for adding this problem and creating all test cases."¿
 173. Binary Search Tree Iterator <https://leetcode.com/problems/binary-search-tree-iterator> "Implement an iterator over a binary search tree (BST). Your iterator will be initialized with the root node of a BST.

Calling next() will return the next smallest number in the BST.

Note: next() and hasNext() should run in average $O(1)$ time and uses $O(h)$ memory, where h is the height of the tree.

Credits:

Special thanks to @ts for adding this problem and creating all test cases."¿
 174. Dungeon Game <https://leetcode.com/problems/dungeon-game> "The demons had captured the princess (P) and imprisoned her in the bottom-right corner of a dungeon. The dungeon consists of $M \times N$ rooms laid out in a 2D grid. Our valiant knight (K) was initially positioned in the top-left room and must fight his way through the dungeon to rescue the princess.

The knight has an initial health point represented by a positive integer. If at any point his health point drops to 0 or below, he dies immediately.

Some of the rooms are guarded by demons, so the knight loses health (negative integers) upon entering these rooms; other rooms are either empty (0's) or contain magic orbs that increase the knight's health (positive integers).

In order to reach the princess as quickly as possible, the knight decides to move only rightward or downward in each step.

Write a function to determine the knight's minimum initial health so that he is able to rescue the princess.

For example, given the dungeon below, the initial health of the knight must be at least 7 if he follows the optimal path RIGHT-> RIGHT -> DOWN -> DOWN.

```
-2 (K)
-3
3
```

```
-5
-10
1
```

```
10
30
-5 (P)
```

Notes:

The knight's health has no upper bound.

Any room can contain threats or power-ups, even the first room the knight enters and the bottom-right room where the princess is imprisoned.

Credits:

Special thanks to @stellari for adding this problem and creating all test cases."?
 175. Combine Two Tables <https://leetcode.com/problems/combine-two-tables> "Table:
 Person

Column Name	Type
PersonId	int
FirstName	varchar
LastName	varchar

PersonId is the primary key column for this table.

Table: Address

Column Name	Type
AddressId	int
PersonId	int
City	varchar
State	varchar

AddressId is the primary key column for this table.

Write a SQL query for a report that provides the following information for each person in the Person table, regardless if there is an address for each of those people:

FirstName, LastName, City, State"

176. Second Highest Salary <https://leetcode.com/problems/second-highest-salary> "Write a SQL query to get the second highest salary from the Employee table.

Id	Salary
1	100
2	200
3	300

For example, given the above Employee table, the query should return 200 as the second highest salary. If there is no second highest salary, then the query should return null.

SecondHighestSalary
200

177. Nth Highest Salary <https://leetcode.com/problems/nth-highest-salary> "Write a SQL query to get the nth highest salary from the Employee table.

Id	Salary
1	100
2	200
3	300

```
+-----+
```

For example, given the above Employee table, the nth highest salary where n = 2 is 200. If there is no nth highest salary, then the query should return null.

```
+-----+
| getNthHighestSalary(2) |
+-----+
| 200                     |
+-----+";
```

178. Rank Scores <https://leetcode.com/problems/rank-scores> "Write a SQL query to rank scores. If there is a tie between two scores, both should have the same ranking. Note that after a tie, the next ranking number should be the next consecutive integer value. In other words, there should be no "holes" between ranks.

```
+-----+
| Id | Score |
+-----+
| 1  | 3.50  |
| 2  | 3.65  |
| 3  | 4.00  |
| 4  | 3.85  |
| 5  | 4.00  |
| 6  | 3.65  |
+-----+
```

For example, given the above Scores table, your query should generate the following report (order by highest score):

```
+-----+
| Score | Rank |
+-----+
| 4.00  | 1    |
| 4.00  | 1    |
| 3.85  | 2    |
| 3.65  | 3    |
| 3.65  | 3    |
| 3.50  | 4    |
+-----+";
```

179. Largest Number <https://leetcode.com/problems/largest-number> "Given a list of non negative integers, arrange them such that they form the largest number.

Example 1:

Input: [10,2]
Output: 210

Example 2:

Input: [3,30,34,5,9]
Output: 9534330

Note: The result may be very large, so you need to return a string instead of an integer.

Credits:

Special thanks to @ts for adding this problem and creating all test cases."

180. Consecutive Numbers <https://leetcode.com/problems/consecutive-numbers> "Write a SQL query to find all numbers that appear at least three times consecutively.

```
+-----+
| Id | Num |
+-----+
| 1  | 1   |
| 2  | 1   |
| 3  | 1   |
| 4  | 2   |
| 5  | 1   |
| 6  | 2   |
+-----+
```

```
| 7 | 2 |
+---+---+
```

For example, given the above Logs table, 1 is the only number that appears consecutively for at least three times.

```
+-----+
| ConsecutiveNums |
+-----+
| 1                |
+-----+";
```

181. Employees Earning More Than Their Managers <https://leetcode.com/problems/employees-earning-more-than-their-managers> "The Employee table holds all employees including their managers. Every employee has an Id, and there is also a column for the manager Id.

Id	Name	Salary	ManagerId
1	Joe	70000	3
2	Henry	80000	4
3	Sam	60000	NULL
4	Max	90000	NULL

Given the Employee table, write a SQL query that finds out employees who earn more than their managers. For the above table, Joe is the only employee who earns more than his manager.

```
+-----+
| Employee |
+-----+
| Joe      |
+-----+";
```

182. Duplicate Emails <https://leetcode.com/problems/duplicate-emails> "Write a SQL query to find all duplicate emails in a table named Person.

Id	Email
1	a@b.com
2	c@d.com
3	a@b.com

For example, your query should return the following for the above table:

```
+-----+
| Email |
+-----+
| a@b.com |
+-----+
```

Note: All emails are in lowercase."

183. Customers Who Never Order <https://leetcode.com/problems/customers-who-never-order> "Suppose that a website contains two tables, the Customers table and the Orders table. Write a SQL query to find all customers who never order anything.

Table: Customers.

Id	Name
1	Joe
2	Henry
3	Sam
4	Max

Table: Orders.

Id	CustomerId
1	3
2	1

Using the above tables as example, return the following:

Customers
Henry
Max

184. Department Highest Salary <https://leetcode.com/problems/department-highest-salary> "The Employee table holds all employees. Every employee has an Id, a salary, and there is also a column for the department Id.

Id	Name	Salary	DepartmentId
1	Joe	70000	1
2	Henry	80000	2
3	Sam	60000	2
4	Max	90000	1

The Department table holds all departments of the company.

Id	Name
1	IT
2	Sales

Write a SQL query to find employees who have the highest salary in each of the departments. For the above tables, Max has the highest salary in the IT department and Henry has the highest salary in the Sales department.

Department	Employee	Salary
IT	Max	90000
Sales	Henry	80000

185. Department Top Three Salaries <https://leetcode.com/problems/department-top-three-salaries> "The Employee table holds all employees. Every employee has an Id, and there is also a column for the department Id.

Id	Name	Salary	DepartmentId
1	Joe	70000	1
2	Henry	80000	2
3	Sam	60000	2
4	Max	90000	1
5	Janet	69000	1
6	Randy	85000	1

The Department table holds all departments of the company.

Id	Name
----	------

1	IT
2	Sales

Write a SQL query to find employees who earn the top three salaries in each of the department. For the above tables, your SQL query should return the following rows.

Department	Employee	Salary
IT	Max	90000
IT	Randy	85000
IT	Joe	70000
Sales	Henry	80000
Sales	Sam	60000

187. Repeated DNA Sequences <https://leetcode.com/problems/repeated-dna-sequences>
 "All DNA is composed of a series of nucleotides abbreviated as A, C, G, and T, for example: "ACGAATTCCG". When studying DNA, it is sometimes useful to identify repeated sequences within the DNA."

Write a function to find all the 10-letter-long sequences (substrings) that occur more than once in a DNA molecule.

Example:

Input: s = "AAAAACCCCCAAAAACCCCCCAAAAGGGTTT"

Output: ["AAAAACCCCC", "CCCCCAAAAA"]

188. Best Time to Buy and Sell Stock IV <https://leetcode.com/problems/best-time-to-buy-and-sell-stock-iv>
 "Say you have an array for which the i-th element is the price of a given stock on day i."

Design an algorithm to find the maximum profit. You may complete at most k transactions.

Note:

You may not engage in multiple transactions at the same time (ie, you must sell the stock before you buy again).

Example 1:

Input: [2,4,1], k = 2

Output: 2

Explanation: Buy on day 1 (price = 2) and sell on day 2 (price = 4), profit = 4-2 = 2.

Example 2:

Input: [3,2,6,5,0,3], k = 2

Output: 7

Explanation: Buy on day 2 (price = 2) and sell on day 3 (price = 6), profit = 6-2 = 4.

Then buy on day 5 (price = 0) and sell on day 6 (price = 3), profit = 3-0 = 3.

Credits:

Special thanks to @Freezen for adding this problem and creating all test cases."

189. Rotate Array <https://leetcode.com/problems/rotate-array>
 "Given an array, rotate the array to the right by k steps, where k is non-negative."

Example 1:

Input: [1,2,3,4,5,6,7] and k = 3

Output: [5,6,7,1,2,3,4]

Explanation:

rotate 1 steps to the right: [7,1,2,3,4,5,6]

rotate 2 steps to the right: [6,7,1,2,3,4,5]

the sunny is is

Your script should output the following, sorted by descending frequency:

```
the 4
is 3
sunny 2
day 1
```

Note:

Don't worry about handling ties, it is guaranteed that each word's frequency count is unique.

Could you write it in one-line using Unix pipes?"
 193. Valid Phone Numbers <https://leetcode.com/problems/valid-phone-numbers> "Given a text file file.txt that contains list of phone numbers (one per line), write a one liner bash script to print all valid phone numbers.

You may assume that a valid phone number must appear in one of the following two formats: (xxx) xxx-xxxx or xxx-xxx-xxxx. (x means a digit)

You may also assume each line in the text file must not contain leading or trailing white spaces.

Example:

Assume that file.txt has the following content:

```
987-123-4567
123 456 7890
(123) 456-7890
```

Your script should output the following valid phone numbers:

```
987-123-4567
(123) 456-7890"
```

194. Transpose File <https://leetcode.com/problems/transpose-file> "Given a text file file.txt, transpose its content.

You may assume that each row has the same number of columns and each field is separated by the ' ' character.

Example:

If file.txt has the following content:

```
name age
alice 21
ryan 30
```

Output the following:

```
name alice ryan
age 21 30"
```

195. Tenth Line <https://leetcode.com/problems/tenth-line> "Given a text file file.txt, print just the 10th line of the file.

Example:

Assume that file.txt has the following content:

```
Line 1
Line 2
Line 3
Line 4
Line 5
Line 6
Line 7
```

Line 8
Line 9
Line 10

Your script should output the tenth line, which is:

Line 10

Note:

1. If the file contains less than 10 lines, what should you output?
 2. There's at least three different solutions. Try to explore all possibilities."
195. Tenth Line <https://leetcode.com/problems/tenth-line> "Note:
1. If the file contains less than 10 lines, what should you output?
 2. There's at least three different solutions. Try to explore all possibilities."
196. Delete Duplicate Emails <https://leetcode.com/problems/delete-duplicate-emails> "Write a SQL query to delete all duplicate email entries in a table named Person, keeping only unique emails based on its smallest Id.

Id	Email
1	john@example.com
2	bob@example.com
3	john@example.com

Id is the primary key column for this table.

For example, after running your query, the above Person table should have the following rows:

Id	Email
1	john@example.com
2	bob@example.com

197. Rising Temperature <https://leetcode.com/problems/rising-temperature> "Given a Weather table, write a SQL query to find all dates' Ids with higher temperature compared to its previous (yesterday's) dates.

Id(INT)	RecordDate(DATE)	Temperature(INT)
1	2015-01-01	10
2	2015-01-02	25
3	2015-01-03	20
4	2015-01-04	30

For example, return the following Ids for the above Weather table:

Id
2
4

198. House Robber <https://leetcode.com/problems/house-robber> "You are a professional robber planning to rob houses along a street. Each house has a certain amount of money stashed, the only constraint stopping you from robbing each of them is that adjacent houses have security system connected and it will automatically contact the police if two adjacent houses were broken into on the same night.

Given a list of non-negative integers representing the amount of money of each house, determine the maximum amount of money you can rob tonight without alerting the police.

Example 1:

Input: [1,2,3,1]

Output: 4

Explanation: Rob house 1 (money = 1) and then rob house 3 (money = 3).
Total amount you can rob = 1 + 3 = 4.

Example 2:

Input: [2,7,9,3,1]

Output: 12

Explanation: Rob house 1 (money = 2), rob house 3 (money = 9) and rob house 5 (money = 1).
Total amount you can rob = 2 + 9 + 1 = 12.

Credits:

Special thanks to @ifanchu for adding this problem and creating all test cases. Also thanks to @ts for adding additional test cases."

199. Binary Tree Right Side View <https://leetcode.com/problems/binary-tree-right-side-view> "Given a binary tree, imagine yourself standing on the right side of it, return the values of the nodes you can see ordered from top to bottom.

Example:

Input: [1,2,3,null,5,null,4]

Output: [1, 3, 4]

Explanation:

```

      1           <---
     / \
    2   3       <---
     \   \
     5   4     <---
```

Credits:

Special thanks to @amrsaqr for adding this problem and creating all test cases."

200. Number of Islands <https://leetcode.com/problems/number-of-islands> "Given a 2d grid map of '1's (land) and '0's (water), count the number of islands. An island is surrounded by water and is formed by connecting adjacent lands horizontally or vertically. You may assume all four edges of the grid are all surrounded by water.

Example 1:

Input:

11110

11010

11000

00000

Output: 1

Example 2:

Input:

11000

11000

00100

00011

Output: 3

Credits:

Special thanks to @mithmatt for adding this problem and creating all test cases."

201. Bitwise AND of Numbers Range <https://leetcode.com/problems/bitwise-and-of-numbers-range> "Given a range [m, n] where 0 <= m <= n <= 2147483647, return the bitwise AND of all numbers in this range, inclusive.

Example:

Input: [5,7]
Output: 4

Credits:

Special thanks to @amrsagr for adding this problem and creating all test cases."&
202. Happy Number <https://leetcode.com/problems/happy-number> "Write an algorithm to determine if a number is "happy".

A happy number is a number defined by the following process: Starting with any positive integer, replace the number by the sum of the squares of its digits, and repeat the process until the number equals 1 (where it will stay), or it loops endlessly in a cycle which does not include 1. Those numbers for which this process ends in 1 are happy numbers.

Example:

Input: 19
Output: true
Explanation:
1² + 9² = 82
8² + 2² = 68
6² + 8² = 100
1² + 0² + 0² = 1

Credits:

Special thanks to @mithmatt and @ts for adding this problem and creating all test cases."&
203. Remove Linked List Elements <https://leetcode.com/problems/remove-linked-list-elements> "Remove all elements from a linked list of integers that have value val.

Example:

Input: 1->2->6->3->4->5->6, val = 6
Output: 1->2->3->4->5

Credits:

Special thanks to @mithmatt for adding this problem and creating all test cases."&
204. Count Primes <https://leetcode.com/problems/count-primes> "Count the number of prime numbers less than a non-negative number, n.

Example:

Input: 10
Output: 4
Explanation: There are 4 prime numbers less than 10, they are 2, 3, 5, 7.

Credits:

Special thanks to @mithmatt for adding this problem and creating all test cases."&
205. Isomorphic Strings <https://leetcode.com/problems/isomorphic-strings> "Given two strings s and t, determine if they are isomorphic.

Two strings are isomorphic if the characters in s can be replaced to get t.

All occurrences of a character must be replaced with another character while preserving the order of characters. No two characters may map to the same character but a character may map to itself.

Example 1:

Input: s = "egg", t = "add"
Output: true

Example 2:

Input: s = "foo", t = "bar"
Output: false

Example 3:

Input: s = "paper", t = "title"
Output: true

Note:

You may assume both s and t have the same length."

206. Reverse Linked List <https://leetcode.com/problems/reverse-linked-list> "Reverse a singly linked list.

click to show more hints.

Hint:

A linked list can be reversed either iteratively or recursively. Could you implement both?"

206. Reverse Linked List <https://leetcode.com/problems/reverse-linked-list> "Hint:

A linked list can be reversed either iteratively or recursively. Could you implement both?"

207. Course Schedule <https://leetcode.com/problems/course-schedule> "There are a total of n courses you have to take, labeled from 0 to n - 1.

Some courses may have prerequisites, for example to take course 0 you have to first take course 1, which is expressed as a pair: [0,1]

Given the total number of courses and a list of prerequisite pairs, is it possible for you to finish all courses?

For example:

2, [[1,0]]

There are a total of 2 courses to take. To take course 1 you should have finished course 0. So it is possible.

2, [[1,0],[0,1]]

There are a total of 2 courses to take. To take course 1 you should have finished course 0, and to take course 0 you should also have finished course 1. So it is impossible.

Note:

The input prerequisites is a graph represented by a list of edges, not adjacency matrices. Read more about how a graph is represented.

You may assume that there are no duplicate edges in the input prerequisites.

click to show more hints.

Hints:

This problem is equivalent to finding if a cycle exists in a directed graph. If a cycle exists, no topological ordering exists and therefore it will be impossible to take all courses.

Topological Sort via DFS - A great video tutorial (21 minutes) on Coursera explaining the basic concepts of Topological Sort.

Topological sort could also be done via BFS."

207. Course Schedule <https://leetcode.com/problems/course-schedule> "Hints:

This problem is equivalent to finding if a cycle exists in a directed graph. If a cycle exists, no topological ordering exists and therefore it will be impossible to take all courses.

Topological Sort via DFS - A great video tutorial (21 minutes) on Coursera explaining the basic concepts of Topological Sort.

Topological sort could also be done via BFS."

208. Implement Trie (Prefix Tree) <https://leetcode.com/problems/implement-trie-pre>

fix-tree "Implement a trie with insert, search, and startsWith methods.

Note:

You may assume that all inputs are consist of lowercase letters a-z."&
 209. Minimum Size Subarray Sum <https://leetcode.com/problems/minimum-size-subarray-sum> "More practice:

If you have figured out the $O(n)$ solution, try coding another solution of which the time complexity is $O(n \log n)$."&
 209. Minimum Size Subarray Sum <https://leetcode.com/problems/minimum-size-subarray-sum> "Given an array of n positive integers and a positive integer s , find the minimal length of a contiguous subarray of which the sum $\geq s$. If there isn't one, return 0 instead.

For example, given the array $[2,3,1,2,4,3]$ and $s = 7$,
 the subarray $[4,3]$ has the minimal length under the problem constraint.

click to show more practice.

More practice:

If you have figured out the $O(n)$ solution, try coding another solution of which the time complexity is $O(n \log n)$.

Credits:

Special thanks to @Freezen for adding this problem and creating all test cases."&
 210. Course Schedule II <https://leetcode.com/problems/course-schedule-ii> "There are a total of n courses you have to take, labeled from 0 to $n - 1$.

Some courses may have prerequisites, for example to take course 0 you have to first take course 1 , which is expressed as a pair: $[0,1]$

Given the total number of courses and a list of prerequisite pairs, return the ordering of courses you should take to finish all courses.

There may be multiple correct orders, you just need to return one of them. If it is impossible to finish all courses, return an empty array.

For example:

2, $[[1,0]]$

There are a total of 2 courses to take. To take course 1 you should have finished course 0. So the correct course order is $[0,1]$

4, $[[1,0],[2,0],[3,1],[3,2]]$

There are a total of 4 courses to take. To take course 3 you should have finished both courses 1 and 2. Both courses 1 and 2 should be taken after you finished course 0. So one correct course order is $[0,1,2,3]$. Another correct ordering is $[0,2,1,3]$.

Note:

The input prerequisites is a graph represented by a list of edges, not adjacency matrices. Read more about how a graph is represented.

You may assume that there are no duplicate edges in the input prerequisites.

click to show more hints.

Hints:

This problem is equivalent to finding the topological order in a directed graph. If a cycle exists, no topological ordering exists and therefore it will be impossible to take all courses.

Topological Sort via DFS - A great video tutorial (21 minutes) on Coursera explaining the basic concepts of Topological Sort.

Topological sort could also be done via BFS."

211. Add and Search Word - Data structure design <https://leetcode.com/problems/add-and-search-word-data-structure-design> "Design a data structure that supports the following two operations:

```
void addWord(word)
bool search(word)
```

search(word) can search a literal word or a regular expression string containing only letters a-z or .. A . means it can represent any one letter.

For example:

```
addWord("bad")
addWord("dad")
addWord("mad")
search("pad") -> false
search("bad") -> true
search(".ad") -> true
search("b..") -> true
```

Note:

You may assume that all words are consist of lowercase letters a-z.

click to show hint.

You should be familiar with how a Trie works. If not, please work on this problem: Implement Trie (Prefix Tree) first."

211. Add and Search Word - Data structure design <https://leetcode.com/problems/add-and-search-word-data-structure-design> "You should be familiar with how a Trie works. If not, please work on this problem: Implement Trie (Prefix Tree) first."

212. Word Search II <https://leetcode.com/problems/word-search-ii> "Given a 2D board and a list of words from the dictionary, find all words in the board.

Each word must be constructed from letters of sequentially adjacent cell, where "adjacent" cells are those horizontally or vertically neighboring. The same letter cell may not be used more than once in a word.

For example,

```
Given words = ["oath","pea","eat","rain"] and board =
[
  ['o','a','a','n'],
  ['e','t','a','e'],
  ['i','h','k','r'],
  ['i','f','l','v']
]
```

Return ["eat","oath"].

Note:

You may assume that all inputs are consist of lowercase letters a-z.

click to show hint.

You would need to optimize your backtracking to pass the larger test. Could you stop backtracking earlier?

If the current candidate does not exist in all words' prefix, you could stop backtracking immediately. What kind of data structure could answer such query efficiently? Does a hash table work? Why or why not? How about a Trie? If you would like to learn how to implement a basic trie, please work on this problem: Implement Trie (Prefix Tree) first."

212. Word Search II <https://leetcode.com/problems/word-search-ii> "You would need to optimize your backtracking to pass the larger test. Could you stop backtracking earlier?

If the current candidate does not exist in all words' prefix, you could stop backtracking immediately. What kind of data structure could answer such query efficiently? Does a hash table work? Why or why not? How about a Trie? If you would like to learn how to implement a basic trie, please work on this problem: Implement Trie (Prefix Tree) first."

213. House Robber II <https://leetcode.com/problems/house-robber-ii> "Note: This is an extension of House Robber.

After robbing those houses on that street, the thief has found himself a new place for his thievery so that he will not get too much attention. This time, all houses at this place are arranged in a circle. That means the first house is the neighbor of the last one. Meanwhile, the security system for these houses remain the same as for those in the previous street.

Given a list of non-negative integers representing the amount of money of each house, determine the maximum amount of money you can rob tonight without alerting the police.

Credits:

Special thanks to @Freezen for adding this problem and creating all test cases."

214. Shortest Palindrome <https://leetcode.com/problems/shortest-palindrome> "Given a string S, you are allowed to convert it to a palindrome by adding characters in front of it. Find and return the shortest palindrome you can find by performing this transformation.

For example:

Given "aacecaaa", return "aaacecaaa".

Given "abcd", return "dcbabcd".

Credits:

Special thanks to @ifanchu for adding this problem and creating all test cases. Thanks to @Freezen for additional test cases."

215. Kth Largest Element in an Array <https://leetcode.com/problems/kth-largest-element-in-an-array> "Find the kth largest element in an unsorted array. Note that it is the kth largest element in the sorted order, not the kth distinct element.

For example,

Given [3,2,1,5,6,4] and k = 2, return 5.

Note:

You may assume k is always valid, 1 ≤ k ≤ array's length.

Credits:

Special thanks to @mithmatt for adding this problem and creating all test cases."

216. Combination Sum III <https://leetcode.com/problems/combination-sum-iii> "Find all possible combinations of k numbers that add up to a number n, given that only numbers from 1 to 9 can be used and each combination should be a unique set of numbers.

Example 1:

Input: k = 3, n = 7

Output:

[[1,2,4]]

Example 2:
 Input: k = 3, n = 9
 Output:
 [[1,2,6], [1,3,5], [2,3,4]]

Credits:

Special thanks to @mithmatt for adding this problem and creating all test cases."
 216. Combination Sum III <https://leetcode.com/problems/combination-sum-iii> "Find all possible combinations of k numbers that add up to a number n, given that only numbers from 1 to 9 can be used and each combination should be a unique set of numbers."

216. Combination Sum III <https://leetcode.com/problems/combination-sum-iii> "Example 1:
 Input: k = 3, n = 7
 Output:
 [[1,2,4]]

Example 2:
 Input: k = 3, n = 9
 Output:
 [[1,2,6], [1,3,5], [2,3,4]]"
 217. Contains Duplicate <https://leetcode.com/problems/contains-duplicate> "Given an array of integers, find if the array contains any duplicates. Your function should return true if any value appears at least twice in the array, and it should return false if every element is distinct."
 218. The Skyline Problem <https://leetcode.com/problems/the-skyline-problem> "A city's skyline is the outer contour of the silhouette formed by all the buildings in that city when viewed from a distance. Now suppose you are given the locations and height of all the buildings as shown on a cityscape photo (Figure A), write a program to output the skyline formed by these buildings collectively (Figure B).

The geometric information of each building is represented by a triplet of integers [Li, Ri, Hi], where Li and Ri are the x coordinates of the left and right edge of the ith building, respectively, and Hi is its height. It is guaranteed that 0 ≤ Li, Ri ≤ INT_MAX, 0 < Hi ≤ INT_MAX, and Ri - Li > 0. You may assume all buildings are perfect rectangles grounded on an absolutely flat surface at height 0.

For instance, the dimensions of all buildings in Figure A are recorded as: [[2 9 10], [3 7 15], [5 12 12], [15 20 10], [19 24 8]] .

The output is a list of "key points" (red dots in Figure B) in the format of [[x1, y1], [x2, y2], [x3, y3], ...] that uniquely defines a skyline. A key point is the left endpoint of a horizontal line segment. Note that the last key point, where the rightmost building ends, is merely used to mark the termination of the skyline, and always has zero height. Also, the ground in between any two adjacent buildings should be considered part of the skyline contour.

For instance, the skyline in Figure B should be represented as: [[2 10], [3 15], [7 12], [12 0], [15 10], [20 8], [24, 0]] .

Notes:

The number of buildings in any input list is guaranteed to be in the range [0, 1000

0].

The input list is already sorted in ascending order by the left x position L_i .

The output list must be sorted by the x position.

There must be no consecutive horizontal lines of equal height in the output skyline. For instance, [...[2 3], [4 5], [7 5], [11 5], [12 7]...] is not acceptable; the three lines of height 5 should be merged into one in the final output as such: [...[2 3], [4 5], [12 7], ...]

Credits:

Special thanks to @stellari for adding this problem, creating these two awesome images and all test cases."

219. Contains Duplicate II <https://leetcode.com/problems/contains-duplicate-ii> "Given an array of integers and an integer k, find out whether there are two distinct indices i and j in the array such that $\text{nums}[i] = \text{nums}[j]$ and the absolute difference between i and j is at most k."

220. Contains Duplicate III <https://leetcode.com/problems/contains-duplicate-iii> "Given an array of integers, find out whether there are two distinct indices i and j in the array such that the absolute difference between $\text{nums}[i]$ and $\text{nums}[j]$ is at most t and the absolute difference between i and j is at most k."

221. Maximal Square <https://leetcode.com/problems/maximal-square> "Given a 2D binary matrix filled with 0's and 1's, find the largest square containing only 1's and return its area."

For example, given the following matrix:

```
1 0 1 0 0
1 0 1 1 1
1 1 1 1 1
1 0 0 1 0
```

Return 4.

Credits:

Special thanks to @Freezen for adding this problem and creating all test cases."

222. Count Complete Tree Nodes <https://leetcode.com/problems/count-complete-tree-nodes> "Given a complete binary tree, count the number of nodes."

Definition of a complete binary tree from Wikipedia:

In a complete binary tree every level, except possibly the last, is completely filled, and all nodes in the last level are as far left as possible. It can have between 1 and 2^h nodes inclusive at the last level h."

223. Rectangle Area <https://leetcode.com/problems/rectangle-area> "Find the total area covered by two rectilinear rectangles in a 2D plane."

Each rectangle is defined by its bottom left corner and top right corner as shown in the figure.

Assume that the total area is never beyond the maximum possible value of int.

Credits:

Special thanks to @mithmatt for adding this problem, creating the above image and all test cases."

224. Basic Calculator <https://leetcode.com/problems/basic-calculator> "Implement a basic calculator to evaluate a simple expression string."

The expression string may contain open (and closing parentheses), the plus + or minus sign -, non-negative integers and empty spaces .

You may assume that the given expression is always valid.

Some examples:

```
"1 + 1" = 2
"2-1 + 2" = 3
"(1+(4+5+2)-3)+(6+8)" = 23
```

Note: Do not use the eval built-in library function."

225. Implement Stack using Queues <https://leetcode.com/problems/implement-stack-using-queues> "Implement the following operations of a stack using queues.

push(x) -- Push element x onto stack.

pop() -- Removes the element on top of the stack.

top() -- Get the top element.

empty() -- Return whether the stack is empty.

Notes:

You must use only standard operations of a queue -- which means only push to back, peek/pop from front, size, and is empty operations are valid.

Depending on your language, queue may not be supported natively. You may simulate a queue by using a list or deque (double-ended queue), as long as you use only standard operations of a queue.

You may assume that all operations are valid (for example, no pop or top operations will be called on an empty stack).

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and all test cases."

226. Invert Binary Tree <https://leetcode.com/problems/invert-binary-tree> "Invert a binary tree.

to

Trivia:

This problem was inspired by this original tweet by Max Howell:

Google: 90% of our engineers use the software you wrote (Homebrew), but you can't invert a binary tree on a whiteboard so f*** off."

227. Basic Calculator II <https://leetcode.com/problems/basic-calculator-ii> "Implement a basic calculator to evaluate a simple expression string.

The expression string contains only non-negative integers, +, -, *, / operators and empty spaces . The integer division should truncate toward zero.

You may assume that the given expression is always valid.

Some examples:

```

"3+2*2" = 7
" 3/2 " = 1
" 3+5 / 2 " = 5

```

Note: Do not use the eval built-in library function.

Credits:

Special thanks to @ts for adding this problem and creating all test cases."`
 228. Summary Ranges <https://leetcode.com/problems/summary-ranges> "Given a sorted integer array without duplicates, return the summary of its ranges.

Example 1:

Input: [0,1,2,4,5,7]
 Output: ["0->2","4->5","7"]

Example 2:

Input: [0,2,3,4,6,8,9]
 Output: ["0","2->4","6","8->9"]

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."`
 229. Majority Element II <https://leetcode.com/problems/majority-element-ii> "Given an integer array of size n, find all elements that appear more than $\frac{n}{3}$ times. The algorithm should run in linear time and in O(1) space."`
 230. Kth Smallest Element in a BST <https://leetcode.com/problems/kth-smallest-element-in-a-bst> "Given a binary search tree, write a function kthSmallest to find the kth smallest element in it.

Note:

You may assume k is always valid, $1 \leq k \leq$ BST's total elements.

Follow up:

What if the BST is modified (insert/delete operations) often and you need to find the kth smallest frequently? How would you optimize the kthSmallest routine?

Credits:

Special thanks to @ts for adding this problem and creating all test cases."`
 231. Power of Two <https://leetcode.com/problems/power-of-two> "Given an integer, write a function to determine if it is a power of two.

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."`
 232. Implement Queue using Stacks <https://leetcode.com/problems/implement-queue-using-stacks> "Implement the following operations of a queue using stacks.

push(x) -- Push element x to the back of queue.

pop() -- Removes the element from in front of queue.

peek() -- Get the front element.

empty() -- Return whether the queue is empty.

Notes:

You must use only standard operations of a stack -- which means only push to top, peek/pop from top, size, and is empty operations are valid.

Depending on your language, stack may not be supported natively. You may simulate a stack by using a list or deque (double-ended queue), as long as you use only standard operations of a stack.

You may assume that all operations are valid (for example, no pop or peek operations will be called on an empty queue)."

233. Number of Digit One <https://leetcode.com/problems/number-of-digit-one> "Given an integer n , count the total number of digit 1 appearing in all non-negative integers less than or equal to n .

For example:

Given $n = 13$,

Return 6, because digit 1 occurred in the following numbers: 1, 10, 11, 12, 13."

234. Palindrome Linked List <https://leetcode.com/problems/palindrome-linked-list> "Given a singly linked list, determine if it is a palindrome.

Follow up:

Could you do it in $O(n)$ time and $O(1)$ space?"

235. Lowest Common Ancestor of a Binary Search Tree <https://leetcode.com/problems/lowest-common-ancestor-of-a-binary-search-tree> "Given a binary search tree (BST), find the lowest common ancestor (LCA) of two given nodes in the BST.

According to the definition of LCA on Wikipedia: "The lowest common ancestor is defined between two nodes v and w as the lowest node in T that has both v and w as descendants (where we allow a node to be a descendant of itself)."

For example, the lowest common ancestor (LCA) of nodes 2 and 8 is 6. Another example is LCA of nodes 2 and 4 is 2, since a node can be a descendant of itself according to the LCA definition."

236. Lowest Common Ancestor of a Binary Tree <https://leetcode.com/problems/lowest-common-ancestor-of-a-binary-tree> "Given a binary tree, find the lowest common ancestor (LCA) of two given nodes in the tree.

According to the definition of LCA on Wikipedia: "The lowest common ancestor is defined between two nodes v and w as the lowest node in T that has both v and w as descendants (where we allow a node to be a descendant of itself)."

For example, the lowest common ancestor (LCA) of nodes 5 and 1 is 3. Another example is LCA of nodes 5 and 4 is 5, since a node can be a descendant of itself according to the LCA definition."

237. Delete Node in a Linked List <https://leetcode.com/problems/delete-node-in-a-linked-list> "Write a function to delete a node (except the tail) in a singly linked list, given only access to that node.

Supposed the linked list is 1 -> 2 -> 3 -> 4 and you are given the third node with value 3, the linked list should become 1 -> 2 -> 4 after calling your function."

238. Product of Array Except Self <https://leetcode.com/problems/product-of-array-except-self> "Given an array of n integers where n > 1, nums, return an array output such that output[i] is equal to the product of all the elements of nums except nums[i].

Solve it without division and in O(n).

For example, given [1,2,3,4], return [24,12,8,6].

Follow up:

Could you solve it with constant space complexity? (Note: The output array does not count as extra space for the purpose of space complexity analysis.)"

239. Sliding Window Maximum <https://leetcode.com/problems/sliding-window-maximum> "Given an array nums, there is a sliding window of size k which is moving from the very left of the array to the very right. You can only see the k numbers in the window. Each time the sliding window moves right by one position.

For example,

Given nums = [1,3,-1,-3,5,3,6,7], and k = 3.

Window position	Max
[1 3 -1] -3 5 3 6 7	3
1 [3 -1 -3] 5 3 6 7	3
1 3 [-1 -3 5] 3 6 7	5
1 3 -1 [-3 5 3] 6 7	5
1 3 -1 -3 [5 3 6] 7	6
1 3 -1 -3 5 [3 6 7]	7

Therefore, return the max sliding window as [3,3,5,5,6,7].

Note:

You may assume k is always valid, ie: 1 ≤ k ≤ input array's size for non-empty array.

Follow up:

Could you solve it in linear time?"

240. Search a 2D Matrix II <https://leetcode.com/problems/search-a-2d-matrix-ii> "Write an efficient algorithm that searches for a value in an m x n matrix. This matrix has the following properties:

Integers in each row are sorted in ascending from left to right.
Integers in each column are sorted in ascending from top to bottom.

For example,

Consider the following matrix:

```
[
  [1,   4,  7, 11, 15],
  [2,   5,  8, 12, 19],
  [3,   6,  9, 16, 22],
  [10, 13, 14, 17, 24],
  [18, 21, 23, 26, 30]
]
```

Given target = 5, return true.

Given target = 20, return false."

241. Different Ways to Add Parentheses <https://leetcode.com/problems/different-ways-to-add-parentheses> "Given a string of numbers and operators, return all possible results from computing all the different possible ways to group numbers and operators. The valid operators are +, - and *."

Example 1

Input: "2-1-1".

$((2-1)-1) = 0$

$(2-(1-1)) = 2$

Output: [0, 2]

Example 2

Input: "2*3-4*5"

$(2*(3-(4*5))) = -34$

$((2*3)-(4*5)) = -14$

$((2*(3-4))*5) = -10$

$(2*((3-4)*5)) = -10$

$((2*3)-4)*5 = 10$

Output: [-34, -14, -10, -10, 10]

Credits:

Special thanks to @mithmatt for adding this problem and creating all test cases."

242. Valid Anagram <https://leetcode.com/problems/valid-anagram> "Given two strings s and t, write a function to determine if t is an anagram of s."

For example,

s = "anagram", t = "nagaram", return true.

s = "rat", t = "car", return false.

Note:

You may assume the string contains only lowercase alphabets.

Follow up:

What if the inputs contain unicode characters? How would you adapt your solution to such case?"

257. Binary Tree Paths <https://leetcode.com/problems/binary-tree-paths> "Given a binary tree, return all root-to-leaf paths."

For example, given the following binary tree:

All root-to-leaf paths are:

["1->2->5", "1->3"]

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."

258. Add Digits <https://leetcode.com/problems/add-digits> "Given a non-negative integer num, repeatedly add all its digits until the result has only one digit."

For example:

Given num = 38, the process is like: 3 + 8 = 11, 1 + 1 = 2. Since 2 has only one digit, return it.

Follow up:

Could you do it without any loop/recursion in $O(1)$ runtime?

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."

260. Single Number III <https://leetcode.com/problems/single-number-iii> "Given an array of numbers nums, in which exactly two elements appear only once and all the other elements appear exactly twice. Find the two elements that appear only once.

For example:

Given nums = [1, 2, 1, 3, 2, 5], return [3, 5].

Note:

The order of the result is not important. So in the above example, [5, 3] is also correct.

Your algorithm should run in linear runtime complexity. Could you implement it using only constant space complexity?

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."

262. Trips and Users <https://leetcode.com/problems/trips-and-users> "The Trips table holds all taxi trips. Each trip has a unique Id, while Client_Id and Driver_Id are both foreign keys to the Users_Id at the Users table. Status is an ENUM type of ('completed', 'cancelled_by_driver', 'cancelled_by_client').

Id	Client_Id	Driver_Id	City_Id	Status	Request_at
1	1	10	1	completed	2013-10-01
2	2	11	1	cancelled_by_driver	2013-10-01
3	3	12	6	completed	2013-10-01
4	4	13	6	cancelled_by_client	2013-10-01
5	1	10	1	completed	2013-10-02
6	2	11	6	completed	2013-10-02
7	3	12	6	completed	2013-10-02
8	2	12	12	completed	2013-10-03
9	3	10	12	completed	2013-10-03
10	4	13	12	cancelled_by_driver	2013-10-03

The Users table holds all users. Each user has a unique Users_Id, and Role is an ENUM type of ('client', 'driver', 'partner').

Users_Id	Banned	Role
1	No	client
2	Yes	client
3	No	client
4	No	client
10	No	driver
11	No	driver
12	No	driver
13	No	driver

Write a SQL query to find the cancellation rate of requests made by unbanned users b

etween Oct 1, 2013 and Oct 3, 2013. For the above tables, your SQL query should return the following rows with the cancellation rate being rounded to two decimal places.

Day	Cancellation Rate
2013-10-01	0.33
2013-10-02	0.00
2013-10-03	0.50

Credits:

Special thanks to @caklerlizhou for contributing this question, writing the problem description and adding part of the test cases."

263. Ugly Number <https://leetcode.com/problems/ugly-number> "Write a program to check whether a given number is an ugly number.

Ugly numbers are positive numbers whose prime factors only include 2, 3, 5. For example, 6, 8 are ugly while 14 is not ugly since it includes another prime factor 7.

Note:

1 is typically treated as an ugly number.
Input is within the 32-bit signed integer range.

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."

264. Ugly Number II <https://leetcode.com/problems/ugly-number-ii> "Write a program to find the n-th ugly number.

Ugly numbers are positive numbers whose prime factors only include 2, 3, 5. For example, 1, 2, 3, 4, 5, 6, 8, 9, 10, 12 is the sequence of the first 10 ugly numbers.

Note that 1 is typically treated as an ugly number, and n does not exceed 1690.

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."

268. Missing Number <https://leetcode.com/problems/missing-number> "Given an array containing n distinct numbers taken from 0, 1, 2, ..., n, find the one that is missing from the array.

Example 1

Input: [3,0,1]

Output: 2

Example 2

Input: [9,6,4,2,3,5,7,0,1]

Output: 8

Note:

Your algorithm should run in linear runtime complexity. Could you implement it using only constant extra space complexity?

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."

273. Integer to English Words <https://leetcode.com/problems/integer-to-english-words> "Convert a non-negative integer to its english words representation. Given input is guaranteed to be less than $2^{31} - 1$.

For example,

123 -> "One Hundred Twenty Three"

12345 -> "Twelve Thousand Three Hundred Forty Five"

1234567 -> "One Million Two Hundred Thirty Four Thousand Five Hundred Sixty Seven"

274. H-Index <https://leetcode.com/problems/h-index> "Given an array of citations (each citation is a non-negative integer) of a researcher, write a function to compute the researcher's h-index."

According to the definition of h-index on Wikipedia: "A scientist has index h if h of his/her N papers have at least h citations each, and the other $N - h$ papers have no more than h citations each."

For example, given citations = [3, 0, 6, 1, 5], which means the researcher has 5 papers in total and each of them had received 3, 0, 6, 1, 5 citations respectively. Since the researcher has 3 papers with at least 3 citations each and the remaining two with no more than 3 citations each, his h-index is 3.

Note: If there are several possible values for h, the maximum one is taken as the h-index.

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."

275. H-Index II <https://leetcode.com/problems/h-index-ii> Follow up for H-Index: What if the citations array is sorted in ascending order? Could you optimize your algorithm?"

278. First Bad Version <https://leetcode.com/problems/first-bad-version> "You are a product manager and currently leading a team to develop a new product. Unfortunately, the latest version of your product fails the quality check. Since each version is developed based on the previous version, all the versions after a bad version are also bad."

Suppose you have n versions [1, 2, ..., n] and you want to find out the first bad one, which causes all the following ones to be bad.

You are given an API `bool isBadVersion(version)` which will return whether version is bad. Implement a function to find the first bad version. You should minimize the number of calls to the API.

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."

279. Perfect Squares <https://leetcode.com/problems/perfect-squares> "Given a positive integer n, find the least number of perfect square numbers (for example, 1, 4, 9, 16, ...) which sum to n."

For example, given $n = 12$, return 3 because $12 = 4 + 4 + 4$; given $n = 13$, return 2 because $13 = 4 + 9$.

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."

282. Expression Add Operators <https://leetcode.com/problems/expression-add-operators> "Given a string that contains only digits 0-9 and a target value, return all possibilities to add binary operators (not unary) +, -, or * between the digits so they evaluate to the target value.

Examples:

```
"123", 6 -> ["1+2+3", "1*2*3"]
"232", 8 -> ["2*3+2", "2+3*2"]
"105", 5 -> ["1*0+5", "10-5"]

Special thanks to @davidtan1890 for adding this problem and creating all test cases."

283. Move Zeroes <https://leetcode.com/problems/move-zeroes> "Given an array nums, write a function to move all 0's to the end of it while maintaining the relative order of the non-zero elements.

For example, given `nums = [0, 1, 0, 3, 12]`, after calling your function, `nums` should be `[1, 3, 12, 0, 0]`.

Note:

You must do this in-place without making a copy of the array.
Minimize the total number of operations.

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."

284. Peeking Iterator <https://leetcode.com/problems/peeking-iterator> "Given an Iterator class interface with methods: `next()` and `hasNext()`, design and implement a PeekingIterator that support the `peek()` operation -- it essentially `peek()` at the element that will be returned by the next call to `next()`.

Here is an example. Assume that the iterator is initialized to the beginning of the list: `[1, 2, 3]`.

Call `next()` gets you 1, the first element in the list.

Now you call `peek()` and it returns 2, the next element. Calling `next()` after that still return 2.

You call `next()` the final time and it returns 3, the last element. Calling `hasNext()` after that should return false.

Follow up: How would you extend your design to be generic and work with all types, not just integer?

Credits:

Special thanks to @porker2008 for adding this problem and creating all test cases."

287. Find the Duplicate Number <https://leetcode.com/problems/find-the-duplicate-number>

ber "Given an array nums containing $n + 1$ integers where each integer is between 1 and n (inclusive), prove that at least one duplicate number must exist. Assume that there is only one duplicate number, find the duplicate one.

Note:

You must not modify the array (assume the array is read only).

You must use only constant, $O(1)$ extra space.

Your runtime complexity should be less than $O(n^2)$.

There is only one duplicate number in the array, but it could be repeated more than once.

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."

289. Game of Life <https://leetcode.com/problems/game-of-life> "According to the Wikipedia's article: "The Game of Life, also known simply as Life, is a cellular automaton devised by the British mathematician John Horton Conway in 1970."

Given a board with m by n cells, each cell has an initial state live (1) or dead (0). Each cell interacts with its eight neighbors (horizontal, vertical, diagonal) using the following four rules (taken from the above Wikipedia article):

Any live cell with fewer than two live neighbors dies, as if caused by under-population.

Any live cell with two or three live neighbors lives on to the next generation.

Any live cell with more than three live neighbors dies, as if by over-population..

Any dead cell with exactly three live neighbors becomes a live cell, as if by reproduction.

Write a function to compute the next state (after one update) of the board given its current state.

Follow up:

Could you solve it in-place? Remember that the board needs to be updated at the same time: You cannot update some cells first and then use their updated values to update other cells.

In this question, we represent the board using a 2D array. In principle, the board is infinite, which would cause problems when the active area encroaches the border of the array. How would you address these problems?

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."

290. Word Pattern <https://leetcode.com/problems/word-pattern> "Given a pattern and a string str, find if str follows the same pattern.

Here follow means a full match, such that there is a bijection between a letter in pattern and a non-empty word in str.

Examples:

pattern = "abba", str = "dog cat cat dog" should return true.

pattern = "abba", str = "dog cat cat fish" should return false.

pattern = "aaaa", str = "dog cat cat dog" should return false.

pattern = "abba", str = "dog dog dog dog" should return false.

Notes:

You may assume pattern contains only lowercase letters, and str contains lowercase letters separated by a single space.

Credits:

Special thanks to @minglotus6 for adding this problem and creating all test cases."Ĥ. Nim Game <https://leetcode.com/problems/nim-game> "You are playing the following Nim Game with your friend: There is a heap of stones on the table, each time one of you take turns to remove 1 to 3 stones. The one who removes the last stone will be the winner. You will take the first turn to remove the stones.

Both of you are very clever and have optimal strategies for the game. Write a function to determine whether you can win the game given the number of stones in the heap.

For example, if there are 4 stones in the heap, then you will never win the game: no matter 1, 2, or 3 stones you remove, the last stone will always be removed by your friend.

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."ħ. Find Median from Data Stream <https://leetcode.com/problems/find-median-from-data-stream> "Median is the middle value in an ordered integer list. If the size of the list is even, there is no middle value. So the median is the mean of the two middle value.

Examples:

Examples:

[2,3,4] , the median is 3
[2,3], the median is (2 + 3) / 2 = 2.5

Design a data structure that supports the following two operations:

void addNum(int num) - Add a integer number from the data stream to the data structure.

double findMedian() - Return the median of all elements so far.

For example:

```
addNum(1)
addNum(2)
findMedian() -> 1.5
addNum(3)
findMedian() -> 2
```

Credits:

Special thanks to @Louis1992 for adding this problem and creating all test cases."ĩ. Serialize and Deserialize Binary Tree <https://leetcode.com/problems/serialize-and-deserialize-binary-tree> "Serialization is the process of converting a data structure or object into a sequence of bits so that it can be stored in a file or memory buffer, or transmitted across a network connection link to be reconstructed later in the same or another computer environment.

Design an algorithm to serialize and deserialize a binary tree. There is no restriction on how your serialization/deserialization algorithm should work. You just need to ensure that a binary tree can be serialized to a string and this string can be deserialized to the original tree structure.

For example, you may serialize the following tree

as "[1,2,3,null,null,4,5]", just the same as how LeetCode OJ serializes a binary tree. You do not necessarily need to follow this format, so please be creative and come up with different approaches yourself.

Note: Do not use class member/global/static variables to store states. Your serialize and deserialize algorithms should be stateless.

Credits:

Special thanks to @Louis1992 for adding this problem and creating all test cases."ࣻ. Bulls and Cows <https://leetcode.com/problems/bulls-and-cows> "You are playing the following Bulls and Cows game with your friend: You write down a number and ask your friend to guess what the number is. Each time your friend makes a guess, you provide a hint that indicates how many digits in said guess match your secret number exactly in both digit and position (called "bulls") and how many digits match the secret number but locate in the wrong position (called "cows"). Your friend will use successive guesses and hints to eventually derive the secret number.

For example:

Secret number: "1807"

Friend's guess: "7810"

Hint: 1 bull and 3 cows. (The bull is 8, the cows are 0, 1 and 7.)

Write a function to return a hint according to the secret number and friend's guess, use A to indicate the bulls and B to indicate the cows. In the above example, your function should return "1A3B".

Please note that both secret number and friend's guess may contain duplicate digits, for example:

Secret number: "1123"

Friend's guess: "0111"

In this case, the 1st 1 in friend's guess is a bull, the 2nd or 3rd 1 is a cow, and your function should return "1A1B".

You may assume that the secret number and your friend's guess only contain digits, and their lengths are always equal.

Credits:

Special thanks to @jeantimex for adding this problem and creating all test cases."ࣼ. Longest Increasing Subsequence <https://leetcode.com/problems/longest-increasing-subsequence> "Given an unsorted array of integers, find the length of longest increasing subsequence.

For example,

Given [10, 9, 2, 5, 3, 7, 101, 18],

The longest increasing subsequence is [2, 3, 7, 101], therefore the length is 4. Note that there may be more than one LIS combination, it is only necessary for you to return the length.

Your algorithm should run in O(n²) complexity.

Follow up: Could you improve it to O(n log n) time complexity?

Credits:

Special thanks to @pbrother for adding this problem and creating all test cases."?

301. Remove Invalid Parentheses <https://leetcode.com/problems/remove-invalid-parentheses> "Remove the minimum number of invalid parentheses in order to make the input string valid. Return all possible results.

Note: The input string may contain letters other than the parentheses (and).

Examples:

```
"()()()" -> ["()()()", "(())()"]
"(a)()()" -> ["(a)()()", "(a())()"]
")(" -> [""]
```

Credits:

Special thanks to @hpplayer for adding this problem and creating all test cases."?

303. Range Sum Query - Immutable <https://leetcode.com/problems/range-sum-query-immutable> "Given an integer array nums, find the sum of the elements between indices i and j (i ≤ j), inclusive.

Example:

Given nums = [-2, 0, 3, -5, 2, -1]

```
sumRange(0, 2) -> 1
sumRange(2, 5) -> -1
sumRange(0, 5) -> -3
```

Note:

You may assume that the array does not change.

There are many calls to sumRange function."?

304. Range Sum Query 2D - Immutable <https://leetcode.com/problems/range-sum-query-2d-immutable> "Given a 2D matrix matrix, find the sum of the elements inside the rectangle defined by its upper left corner (row1, col1) and lower right corner (row2, col2).

The above rectangle (with the red border) is defined by (row1, col1) = (2, 1) and (row2, col2) = (4, 3), which contains sum = 8.

Example:

```
Given matrix = [
  [3, 0, 1, 4, 2],
  [5, 6, 3, 2, 1],
  [1, 2, 0, 1, 5],
  [4, 1, 0, 1, 7],
  [1, 0, 3, 0, 5]
]
```

```
sumRegion(2, 1, 4, 3) -> 8
sumRegion(1, 1, 2, 2) -> 11
sumRegion(1, 2, 2, 4) -> 12
```

Note:

You may assume that the matrix does not change.

There are many calls to sumRegion function.

You may assume that row1 \leq row2 and col1 \leq col2.">
 306. Additive Number <https://leetcode.com/problems/additive-number> "Additive number is a string whose digits can form additive sequence.

A valid additive sequence should contain at least three numbers. Except for the first two numbers, each subsequent number in the sequence must be the sum of the preceding two.

For example:

"112358" is an additive number because the digits can form an additive sequence: 1, 1, 2, 3, 5, 8.
 $1 + 1 = 2$, $1 + 2 = 3$, $2 + 3 = 5$, $3 + 5 = 8$
 "199100199" is also an additive number, the additive sequence is: 1, 99, 100, 199.
 $1 + 99 = 100$, $99 + 100 = 199$

Note: Numbers in the additive sequence cannot have leading zeros, so sequence 1, 2, 03 or 1, 02, 3 is invalid.

Given a string containing only digits '0'-'9', write a function to determine if it's an additive number.

Follow up:

How would you handle overflow for very large input integers?

Credits:

Special thanks to @jeantimex for adding this problem and creating all test cases.">
 307. Range Sum Query - Mutable <https://leetcode.com/problems/range-sum-query-mutable>
 "Given an integer array nums, find the sum of the elements between indices i and j (i \leq j), inclusive.

The update(i, val) function modifies nums by updating the element at index i to val.

Example:

Given nums = [1, 3, 5]

sumRange(0, 2) -> 9

update(1, 2)

sumRange(0, 2) -> 8

Note:

The array is only modifiable by the update function.

You may assume the number of calls to update and sumRange function is distributed evenly.">

309. Best Time to Buy and Sell Stock with Cooldown <https://leetcode.com/problems/best-time-to-buy-and-sell-stock-with-cooldown> "Say you have an array for which the i-th element is the price of a given stock on day i.

Design an algorithm to find the maximum profit. You may complete as many transactions as you like (ie, buy one and sell one share of the stock multiple times) with the following restrictions:

You may not engage in multiple transactions at the same time (ie, you must sell the stock before you buy again).

After you sell your stock, you cannot buy stock on next day. (ie, cooldown 1 day)

Example:

```
prices = [1, 2, 3, 0, 2]
maxProfit = 3
transactions = [buy, sell, cooldown, buy, sell]
```

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases."&310. Minimum Height Trees <https://leetcode.com/problems/minimum-height-trees> "For a undirected graph with tree characteristics, we can choose any node as the root. The result graph is then a rooted tree. Among all possible rooted trees, those with minimum height are called minimum height trees (MHTs).

Given such a graph, write a function to find all the MHTs and return a list of their root labels.

Format

The graph contains n nodes which are labeled from 0 to $n - 1$.

You will be given the number n and a list of undirected edges (each edge is a pair of labels).

You can assume that no duplicate edges will appear in edges. Since all edges are undirected, $[0, 1]$ is the same as $[1, 0]$ and thus will not appear together in edges.

Example 1:

Given $n = 4$, edges = $[[1, 0], [1, 2], [1, 3]]$

```
return [1]
```

Example 2:

Given $n = 6$, edges = $[[0, 3], [1, 3], [2, 3], [4, 3], [5, 4]]$

```
return [3, 4]
```

Note:

(1) According to the definition of tree on Wikipedia: "a tree is an undirected graph in which any two vertices are connected by exactly one path. In other words, any connected graph without simple cycles is a tree."

(2) The height of a rooted tree is the number of edges on the longest downward path between the root and a leaf.

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases."& 312. Burst Balloons <https://leetcode.com/problems/burst-balloons> "Given n balloons s, indexed from 0 to n-1. Each balloon is painted with a number on it represented by array nums.

You are asked to burst all the balloons. If the you burst balloon i you will get $\text{nums}[\text{left}] * \text{nums}[i] * \text{nums}[\text{right}]$ coins. Here left and right are adjacent indices of i. After the burst, the left and right then becomes adjacent.

Find the maximum coins you can collect by bursting the balloons wisely.

Note:

(1) You may imagine $\text{nums}[-1] = \text{nums}[n] = 1$. They are not real therefore you can not burst them.

(2) $0 \leq n \leq 500$, $0 \leq \text{nums}[i] \leq 100$

Example:

Given [3, 1, 5, 8]

Return 167

nums = [3,1,5,8] --> [3,5,8] --> [3,8] --> [8] --> []
 coins = 3*1*5 + 3*5*8 + 1*3*8 + 1*8*1 = 167

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases."& 313. Super Ugly Number <https://leetcode.com/problems/super-ugly-number> "Write a program to find the nth super ugly number.

Super ugly numbers are positive numbers whose all prime factors are in the given prime list

primes of size k. For example, [1, 2, 4, 7, 8, 13, 14, 16, 19, 26, 28, 32] is the sequence of the first 12 super ugly numbers given primes = [2, 7, 13, 19] of size 4.

Note:

(1) 1 is a super ugly number for any given primes.

(2) The given numbers in primes are in ascending order.

(3) $0 < k \leq 100$, $0 < n \leq 106$, $0 < \text{primes}[i] < 1000$.

(4) The nth super ugly number is guaranteed to fit in a 32-bit signed integer.

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases."& 315. Count of Smaller Numbers After Self <https://leetcode.com/problems/count-of-smaller-numbers-after-self> "You are given an integer array nums and you have to return an array of the same size where each element is the count of smaller elements to its right.

urn a new counts array.
The counts array has the property where counts[i] is
the number of smaller elements to the right of nums[i].

Example:

Given nums = [5, 2, 6, 1]

To the right of 5 there are 2 smaller elements (2 and 1).
To the right of 2 there is only 1 smaller element (1).
To the right of 6 there is 1 smaller element (1).
To the right of 1 there is 0 smaller element.

Return the array [2, 1, 1, 0]."

316. Remove Duplicate Letters <https://leetcode.com/problems/remove-duplicate-letters> "Given a string which contains only lowercase letters, remove duplicate letters so that every letter appear once and only once. You must make sure your result is the smallest in lexicographical order among all possible results.

Example:

Given "bcabc"

Return "abc"

Given "cbacdcbc"

Return "acdb"

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases."
318. Maximum Product of Word Lengths <https://leetcode.com/problems/maximum-product-of-word-lengths> "Given a string array words, find the maximum value of length(word[i]) * length(word[j]) where the two words do not share common letters.
You may assume that each word will contain only lower case letters.
If no such two words exist, return 0.

Example 1:

Given ["abcw", "baz", "foo", "bar", "xtfn", "abcdef"]

Return 16

The two words can be "abcw", "xtfn".

Example 2:

Given ["a", "ab", "abc", "d", "cd", "bcd", "abcd"]

Return 4

The two words can be "ab", "cd".

Example 3:

Given ["a", "aa", "aaa", "aaaa"]

Return 0

No such pair of words.

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases."Ŀ. Bulb Switcher <https://leetcode.com/problems/bulb-switcher> "There are n bulbs that are initially off. You first turn on all the bulbs. Then, you turn off every second bulb. On the third round, you toggle every third bulb (turning on if it's off or turning off if it's on). For the ith round, you toggle every i bulb. For the nth round, you only toggle the last bulb.

Find how many bulbs are on after n rounds.

Example:

Given n = 3.

At first, the three bulbs are [off, off, off].

After first round, the three bulbs are [on, on, on].

After second round, the three bulbs are [on, off, on].

After third round, the three bulbs are [on, off, off].

So you should return 1, because there is only one bulb is on."Ł. Create Maximum Number <https://leetcode.com/problems/create-maximum-number> "Given two arrays of length m and n with digits 0-9 representing two numbers.

Create the maximum number of length k <= m + n from digits of the two. The relative order of the digits

from the same array must be preserved. Return an array of the k digits. You should try to optimize your time and space complexity.

Example 1:

nums1 = [3, 4, 6, 5]

nums2 = [9, 1, 2, 5, 8, 3]

k = 5

return [9, 8, 6, 5, 3]

Example 2:

nums1 = [6, 7]

nums2 = [6, 0, 4]

k = 5

return [6, 7, 6, 0, 4]

Example 3:

nums1 = [3, 9]

nums2 = [8, 9]

```
k = 3

return [9, 8, 9]
```

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."&
 324. Wiggle Sort II <https://leetcode.com/problems/wiggle-sort-ii> "Given an unsorted array nums, reorder it such that
 nums[0] < nums[1] > nums[2] < nums[3]....

Example:

- (1) Given nums = [1, 5, 1, 1, 6, 4], one possible answer is [1, 4, 1, 5, 1, 6].
- (2) Given nums = [1, 3, 2, 2, 3, 1], one possible answer is [2, 3, 1, 3, 1, 2].

Note:

You may assume all input has valid answer.

Follow Up:

Can you do it in $O(n)$ time and/or in-place with $O(1)$ extra space?

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases."&
 326. Power of Three <https://leetcode.com/problems/power-of-three> "Given an integer r, write a function to determine if it is a power of three.

Follow up:

Could you do it without using any loop / recursion?

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases."&
 327. Count of Range Sum <https://leetcode.com/problems/count-of-range-sum> "Given a
 n integer array nums, return the number of range sums that lie in [lower, upper] inc
 lusive.

Range sum $S(i, j)$ is defined as the sum of the elements in nums between indices
 i and
 j ($i \leq j$), inclusive.

Note:

A naive algorithm of $O(n^2)$ is trivial. You MUST do better than that.

Example:

Given nums = [-2, 5, -1], lower = -2, upper = 2,

Return 3.

The three ranges are : [0, 0], [2, 2], [0, 2] and their respective sums are: -2,
 -1, 2.

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases."&
 328. Odd Even Linked List <https://leetcode.com/problems/odd-even-linked-list> "Giv
 en a singly linked list, group all odd nodes together followed by the even nodes. Pl
 ease note here we are talking about the node number and not the value in the nodes.

You should try to do it in place. The program should run in $O(1)$ space complexity an
 d $O(\text{nodes})$ time complexity.

Example:

Given 1->2->3->4->5->NULL,

return 1->3->5->2->4->NULL.

Note:

The relative order inside both the even and odd groups should remain as it was in th
 e input.

The first node is considered odd, the second node even and so on ...

Credits:

Special thanks to @DjangoUnchained for adding this problem and creating all test cas
 es."&
 329. Longest Increasing Path in a Matrix <https://leetcode.com/problems/longest-increasing-path-in-a-matrix> "Given an integer matrix, find the length of the longest
 increasing path.

From each cell, you can either move to four directions: left, right, up or down. You
 may NOT move diagonally or move outside of the boundary (i.e. wrap-around is not al
 lowed).

Example 1:

```
nums = [
  [9,9,4],
  [6,6,8],
  [2,1,1]
]
```

Return 4

The longest increasing path is [1, 2, 6, 9].

Example 2:

```
nums = [
    [3,4,5],
    [3,2,6],
    [2,2,1]
]
```

Return 4

The longest increasing path is [3, 4, 5, 6]. Moving diagonally is not allowed.

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases."&330. Patching Array <https://leetcode.com/problems/patching-array> "Given a sorted positive integer array nums and an integer n, add/patch elements to the array such that any number in range [1, n] inclusive can be formed by the sum of some elements in the array. Return the minimum number of patches required.

Example 1:

```
nums = [1, 3], n = 6
```

Return 1.

Combinations of nums are [1], [3], [1,3], which form possible sums of: 1, 3, 4.

Now if we add/patch 2 to nums, the combinations are: [1], [2], [3], [1,3], [2,3], [1,2,3].

Possible sums are 1, 2, 3, 4, 5, 6, which now covers the range [1, 6].

So we only need 1 patch.

Example 2:

```
nums = [1, 5, 10], n = 20
```

Return 2.

The two patches can be [2, 4].

Example 3:

```
nums = [1, 2, 2], n = 5
```

Return 0.

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases."&331. Verify Preorder Serialization of a Binary Tree <https://leetcode.com/problems/verify-preorder-serialization-of-a-binary-tree> "One way to serialize a binary tree is to use pre-order traversal. When we encounter a non-null node, we record the node's value. If it is a null node, we record using a sentinel value such as #.

```

    / \   / \
   4  1  #  6
  / \ / \ / \
 #  # #  # #  #

```

For example, the above binary tree can be serialized to the string `"9,3,4,#,#,1,#,#,2,#,6,#,#"`, where `#` represents a null node.

Given a string of comma separated values, verify whether it is a correct preorder traversal serialization of a binary tree. Find an algorithm without reconstructing the tree.

Each comma separated value in the string must be either an integer or a character `'#'` representing null pointer.

You may assume that the input format is always valid, for example it could never contain two consecutive commas such as `"1,,3"`.

Example 1:

```
"9,3,4,#,#,1,#,#,2,#,6,#,#"
```

Return true

Example 2:

```
"1,#"
```

Return false

Example 3:

```
"9,#,#,1"
```

Return false

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases. 332. Reconstruct Itinerary <https://leetcode.com/problems/reconstruct-itinerary> Given a list of airline tickets represented by pairs of departure and arrival airports [from, to], reconstruct the itinerary in order. All of the tickets belong to a man who departs from JFK. Thus, the itinerary must begin with JFK.

Note:

If there are multiple valid itineraries, you should return the itinerary that has the smallest lexical order when read as a single string. For example, the itinerary `["JFK", "LGA"]` has a smaller lexical order than `["JFK", "LGB"]`.

All airports are represented by three capital letters (IATA code).

You may assume all tickets form at least one valid itinerary.

Example 1:

```
tickets = [{"MUC", "LHR"}, {"JFK", "MUC"}, {"SFO", "SJC"}, {"LHR", "SFO"}]
```

```
Return ["JFK", "MUC", "LHR", "SFO", "SJC"].
```

Example 2:

```
tickets = [{"JFK", "SFO"}, {"JFK", "ATL"}, {"SFO", "ATL"}, {"ATL", "JFK"}, {"ATL", "SFO"}]
```

```
Return ["JFK", "ATL", "JFK", "SFO", "ATL", "SFO"].
```

Another possible reconstruction is `["JFK", "SFO", "ATL", "JFK", "ATL", "SF"]`.

0"]. But it is larger in lexical order.

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases."Ŏ. Increasing Triplet Subsequence <https://leetcode.com/problems/increasing-triplet-subsequence> "Given an unsorted array return whether an increasing subsequence of length 3 exists or not in the array.

Formally the function should:

Return true if there exists i, j, k

such that $arr[i] < arr[j] < arr[k]$ given $0 \leq i < j < k \leq n-1$
else return false.

Your algorithm should run in $O(n)$ time complexity and $O(1)$ space complexity.

Examples:

Given [1, 2, 3, 4, 5],
return true.

Given [5, 4, 3, 2, 1],
return false.

Credits:

Special thanks to @DjangoUnchained for adding this problem and creating all test cases."ŏ. Self Crossing <https://leetcode.com/problems/self-crossing> "You are given an array x of n positive numbers. You start at point (0,0) and moves x[0] metres to the north, then x[1] metres to the west, x[2] metres to the south, x[3] metres to the east and so on. In other words, after each move your direction changes counter-clockwise.

Write a one-pass algorithm with $O(1)$ extra space to determine, if your path crosses itself, or not.

Example 1:

Given x = [2, 1, 1, 2],
?????
? ?
???????>
?

Return true (self crossing)

Example 2:

Given x = [1, 2, 3, 4],
????????
? ?
?
?
????????????????>

Return false (not self crossing)

Example 3:

Given x = [1, 1, 1, 1],
 ?????
 ? ?
 ?????>

Return true (self crossing)

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases."!
 336. Palindrome Pairs <https://leetcode.com/problems/palindrome-pairs> "Given a list of unique words, find all pairs of distinct indices (i, j) in the given list, so that the concatenation of the two words, i.e. words[i] + words[j] is a palindrome."

Example 1:

Given words = ["bat", "tab", "cat"]
 Return [[0, 1], [1, 0]]
 The palindromes are ["battab", "tabbat"]

Example 2:

Given words = ["abcd", "dcba", "lls", "s", "sssll"]
 Return [[0, 1], [1, 0], [3, 2], [2, 4]]
 The palindromes are ["dcbaabcd", "abcddcba", "slls", "llssssll"]

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases."!
 337. House Robber III <https://leetcode.com/problems/house-robber-iii> "The thief has found himself a new place for his thievery again. There is only one entrance to this area, called the "root." Besides the root, each house has one and only one parent house. After a tour, the smart thief realized that "all houses in this place forms a binary tree". It will automatically contact the police if two directly-linked houses were broken into on the same night."

Determine the maximum amount of money the thief can rob tonight without alerting the police.

Example 1:

Maximum amount of money the thief can rob = 3 + 3 + 1 = 7.

Example 2:

3

Maximum amount of money the thief can rob = 4 + 5 = 9.

Credits:

Special thanks to @dietpepsi for adding this problem and creating all test cases."!
 338. Counting Bits <https://leetcode.com/problems/counting-bits> "Given a non negative integer number num. For every numbers i in the range 0 ≤ i ≤ num calculate the number of 1's in their binary representation and return them as an array.

Example:

For num = 5 you should return [0,1,1,2,1,2].

Follow up:

It is very easy to come up with a solution with run time $O(n \cdot \text{sizeof}(\text{integer}))$. But can you do it in linear time $O(n)$ /possibly in a single pass?
 Space complexity should be $O(n)$.
 Can you do it like a boss? Do it without using any builtin function like `__builtin_popcount` in c++ or in any other language.

Credits:

Special thanks to @syedee for adding this problem and creating all test cases."!
 341. Flatten Nested List Iterator <https://leetcode.com/problems/flatten-nested-list-iterator> "Given a nested list of integers, implement an iterator to flatten it.

Each element is either an integer, or a list -- whose elements may also be integers or other lists.

Example 1:

Given the list `[[1,1],2,[1,1]]`,

By calling next repeatedly until hasNext returns false, the order of elements returned by next should be: `[1,1,2,1,1]`.

Example 2:

Given the list `[1,[4,[6]]]`,

By calling next repeatedly until hasNext returns false, the order of elements returned by next should be: `[1,4,6]`."

342. Power of Four <https://leetcode.com/problems/power-of-four> "Given an integer (signed 32 bits), write a function to check whether it is a power of 4.

Example:

Given num = 16, return true.
 Given num = 5, return false.

Follow up: Could you solve it without loops/recursion?

Credits:

Special thanks to @yukuairoy for adding this problem and creating all test cases."!
 343. Integer Break <https://leetcode.com/problems/integer-break> "Given a positive integer n, break it into the sum of at least two positive integers and maximize the product of those integers. Return the maximum product you can get.

For example, given n = 2, return 1 (2 = 1 + 1); given n = 10, return 36 (10 = 3 + 3 + 4).

+ 4).

Note: You may assume that n is not less than 2 and not larger than 58.

Credits:

Special thanks to @jianchao.li.fighter for adding this problem and creating all test cases."

344. Reverse String <https://leetcode.com/problems/reverse-string> "Write a function that takes a string as input and returns the string reversed."

Example:

Given $s = \text{"hello"}$, return "olleh" ."

345. Reverse Vowels of a String <https://leetcode.com/problems/reverse-vowels-of-a-string> "Write a function that takes a string as input and reverse only the vowels of a string."

Example 1:

Given $s = \text{"hello"}$, return "holle" .

Example 2:

Given $s = \text{"leetcode"}$, return "leotcede" .

Note:

The vowels does not include the letter "y" ."

347. Top K Frequent Elements <https://leetcode.com/problems/top-k-frequent-elements> "Given a non-empty array of integers, return the k most frequent elements."

For example,

Given $[1,1,1,2,2,3]$ and $k = 2$, return $[1,2]$.

Note:

You may assume k is always valid, $1 \leq k \leq$ number of unique elements.

Your algorithm's time complexity must be better than $O(n \log n)$, where n is the array's size."

349. Intersection of Two Arrays <https://leetcode.com/problems/intersection-of-two-arrays> "Given two arrays, write a function to compute their intersection."

Example:

Given $\text{nums1} = [1, 2, 2, 1]$, $\text{nums2} = [2, 2]$, return $[2]$.

Note:

Each element in the result must be unique.

The result can be in any order."

350. Intersection of Two Arrays II <https://leetcode.com/problems/intersection-of-two-arrays-ii> "Given two arrays, write a function to compute their intersection."

Example:

Given $\text{nums1} = [1, 2, 2, 1]$, $\text{nums2} = [2, 2]$, return $[2, 2]$.

Note:

Each element in the result should appear as many times as it shows in both arrays. The result can be in any order.

Follow up:

What if the given array is already sorted? How would you optimize your algorithm? What if nums1's size is small compared to nums2's size? Which algorithm is better? What if elements of nums2 are stored on disk, and the memory is limited such that you cannot load all elements into the memory at once?"

352. Data Stream as Disjoint Intervals <https://leetcode.com/problems/data-stream-as-disjoint-intervals> "Given a data stream input of non-negative integers a1, a2, ..., an, ..., summarize the numbers seen so far as a list of disjoint intervals.

For example, suppose the integers from the data stream are 1, 3, 7, 2, 6, ..., then the summary will be:

```
[1, 1]
[1, 1], [3, 3]
[1, 1], [3, 3], [7, 7]
[1, 3], [7, 7]
[1, 3], [6, 7]
```

Follow up:

What if there are lots of merges and the number of disjoint intervals are small compared to the data stream's size?

Credits:

Special thanks to @yunhong for adding this problem and creating most of the test cases."

354. Russian Doll Envelopes <https://leetcode.com/problems/russian-doll-envelopes> "You have a number of envelopes with widths and heights given as a pair of integers (w, h). One envelope can fit into another if and only if both the width and height of one envelope is greater than the width and height of the other envelope.

What is the maximum number of envelopes can you Russian doll? (put one inside other)

Example:

Given envelopes = [[5,4],[6,4],[6,7],[2,3]], the maximum number of envelopes you can Russian doll is 3 ([2,3] => [5,4] => [6,7])."

355. Design Twitter <https://leetcode.com/problems/design-twitter> "Design a simplified version of Twitter where users can post tweets, follow/unfollow another user and is able to see the 10 most recent tweets in the user's news feed. Your design should support the following methods:

```
postTweet(userId, tweetId): Compose a new tweet.
getNewsFeed(userId): Retrieve the 10 most recent tweet ids in the user's news feed. Each item in the news feed must be posted by users who the user followed or by the user herself. Tweets must be ordered from most recent to least recent.
follow(followerId, followeeId): Follower follows a followee.
unfollow(followerId, followeeId): Follower unfollows a followee.
```

Example:

```
Twitter twitter = new Twitter();

// User 1 posts a new tweet (id = 5).
twitter.postTweet(1, 5);
```

```
// User 1's news feed should return a list with 1 tweet id -> [5].
twitter.getNewsFeed(1);

// User 1 follows user 2.
twitter.follow(1, 2);

// User 2 posts a new tweet (id = 6).
twitter.postTweet(2, 6);

// User 1's news feed should return a list with 2 tweet ids -> [6, 5].
// Tweet id 6 should precede tweet id 5 because it is posted after tweet id 5.
twitter.getNewsFeed(1);

// User 1 unfollows user 2.
twitter.unfollow(1, 2);

// User 1's news feed should return a list with 1 tweet id -> [5],
// since user 1 is no longer following user 2.
twitter.getNewsFeed(1);"
357. Count Numbers with Unique Digits https://leetcode.com/problems/count-numbers-with-unique-digits "Given a non-negative integer n, count all numbers with unique digits, x, where 0 ≤ x < 10n.
```

Example:

Given n = 2, return 91. (The answer should be the total numbers in the range of 0 ≤ x < 100, excluding [11,22,33,44,55,66,77,88,99])

Credits:

Special thanks to @memoryless for adding this problem and creating all test cases."
363. Max Sum of Rectangle No Larger Than K <https://leetcode.com/problems/max-sum-of-rectangle-no-larger-than-k> "Given a non-empty 2D matrix matrix and an integer k, find the max sum of a rectangle in the matrix such that its sum is no larger than k.

Example:

```
Given matrix = [
  [1, 0, 1],
  [0, -2, 3]
]
k = 2
```

The answer is 2. Because the sum of rectangle [[0, 1], [-2, 3]] is 2 and 2 is the max number no larger than k (k = 2).

Note:

The rectangle inside the matrix must have an area > 0.
What if the number of rows is much larger than the number of columns?

Credits:

Special thanks to @fujiaozhu for adding this problem and creating all test cases."
365. Water and Jug Problem <https://leetcode.com/problems/water-and-jug-problem> "You are given two jugs with capacities x and y litres. There is an infinite amount of water supply available. You need to determine whether it is possible to measure exactly z litres using these two jugs.

If z liters of water is measurable, you must have z liters of water contained within one or both buckets by the end.

Operations allowed:

Fill any of the jugs completely with water.
Empty any of the jugs.

Pour water from one jug into another till the other jug is completely full or the first jug itself is empty.

Example 1: (From the famous "Die Hard" example)

Input: x = 3, y = 5, z = 4

Output: True

Example 2:

Input: x = 2, y = 6, z = 5

Output: False

Credits:

Special thanks to @vinod23 for adding this problem and creating all test cases."ů. Valid Perfect Square <https://leetcode.com/problems/valid-perfect-square> "Given a positive integer num, write a function which returns True if num is a perfect square else False.

Note: Do not use any built-in library function such as sqrt.

Example 1:

Input: 16

Returns: True

Example 2:

Input: 14

Returns: False

Credits:

Special thanks to @elmirap for adding this problem and creating all test cases."Ű. Largest Divisible Subset <https://leetcode.com/problems/largest-divisible-subset> "Given a set of distinct positive integers, find the largest subset such that every pair (Si, Sj) of elements in this subset satisfies: Si % Sj = 0 or Sj % Si = 0.

If there are multiple solutions, return any subset is fine.

Example 1:

nums: [1,2,3]

Result: [1,2] (of course, [1,3] will also be ok)

Example 2:

nums: [1,2,4,8]

Result: [1,2,4,8]

Credits:

Special thanks to @Stomach_ache for adding this problem and creating all test cases."ų. Sum of Two Integers <https://leetcode.com/problems/sum-of-two-integers> "Calculate the sum of two integers a and b, but you are not allowed to use the operator + and -.

Example:

Given a = 1 and b = 2, return 3.

Credits:

Special thanks to @fujiaozhu for adding this problem and creating all test cases."¿
 372. Super Pow <https://leetcode.com/problems/super-pow> "Your task is to calculate $a^b \bmod 1337$ where a is a positive integer and b is an extremely large positive integer given in the form of an array.

Example1:

$a = 2$
 $b = [3]$

Result: 8

Example2:

$a = 2$
 $b = [1,0]$

Result: 1024

Credits:

Special thanks to @Stomach_ache for adding this problem and creating all test cases."
 ¿
 373. Find K Pairs with Smallest Sums <https://leetcode.com/problems/find-k-pairs-with-smallest-sums> "You are given two integer arrays $nums1$ and $nums2$ sorted in ascending order and an integer k .

Define a pair (u,v) which consists of one element from the first array and one element from the second array.

Find the k pairs $(u_1,v_1),(u_2,v_2) \dots (u_k,v_k)$ with the smallest sums.

Example 1:

Given $nums1 = [1,7,11]$, $nums2 = [2,4,6]$, $k = 3$

Return: $[1,2],[1,4],[1,6]$

The first 3 pairs are returned from the sequence:

$[1,2],[1,4],[1,6],[7,2],[7,4],[11,2],[7,6],[11,4],[11,6]$

Example 2:

Given $nums1 = [1,1,2]$, $nums2 = [1,2,3]$, $k = 2$

Return: $[1,1],[1,1]$

The first 2 pairs are returned from the sequence:

$[1,1],[1,1],[1,2],[2,1],[1,2],[2,2],[1,3],[1,3],[2,3]$

Example 3:

Given $nums1 = [1,2]$, $nums2 = [3]$, $k = 3$

Return: $[1,3],[2,3]$

All possible pairs are returned from the sequence:

$[1,3],[2,3]$

Credits:

Special thanks to @elmirap and @StefanPochmann for adding this problem and creating all test cases."

374. Guess Number Higher or Lower <https://leetcode.com/problems/guess-number-higher-or-lower> "We are playing the Guess Game. The game is as follows:

I pick a number from 1 to n. You have to guess which number I picked.

Every time you guess wrong, I'll tell you whether the number is higher or lower.

You call a pre-defined API guess(int num) which returns 3 possible results (-1, 1, or 0):

-1 : My number is lower
1 : My number is higher
0 : Congrats! You got it!

Example:

n = 10, I pick 6.

Return 6."

375. Guess Number Higher or Lower II <https://leetcode.com/problems/guess-number-higher-or-lower-ii> "We are playing the Guess Game. The game is as follows:

I pick a number from 1 to n. You have to guess which number I picked.

Every time you guess wrong, I'll tell you whether the number I picked is higher or lower.

However, when you guess a particular number x, and you guess wrong, you pay \$x. You win the game when you guess the number I picked.

Example:

n = 10, I pick 8.

First round: You guess 5, I tell you that it's higher. You pay \$5.

Second round: You guess 7, I tell you that it's higher. You pay \$7.

Third round: You guess 9, I tell you that it's lower. You pay \$9.

Game over. 8 is the number I picked.

You end up paying \$5 + \$7 + \$9 = \$21.

Given a particular n ≥ 1, find out how much money you need to have to guarantee a win.

Credits:

Special thanks to @agave and @StefanPochmann for adding this problem and creating all test cases."

376. Wiggle Subsequence <https://leetcode.com/problems/wiggle-subsequence> "A sequence of numbers is called a wiggle sequence if the differences between successive numbers strictly alternate between positive and negative. The first difference (if one exists) may be either positive or negative. A sequence with fewer than two elements is trivially a wiggle sequence.

For example, [1,7,4,9,2,5] is a wiggle sequence because the differences (6,-3,5,-7,3) are alternately positive and negative. In contrast, [1,4,7,2,5] and [1,7,4,5,5] are not wiggle sequences, the first because its first two differences are positive and the second because its last difference is zero.

Given a sequence of integers, return the length of the longest subsequence that is a wiggle sequence. A subsequence is obtained by deleting some number of elements (eventually, also zero) from the original sequence, leaving the remaining elements in their original order.

Examples:

Input: [1,7,4,9,2,5]

Output: 6

The entire sequence is a wiggle sequence.

Input: [1,17,5,10,13,15,10,5,16,8]

Output: 7

There are several subsequences that achieve this length. One is [1,17,10,13,10,16,8]
.

Input: [1,2,3,4,5,6,7,8,9]

Output: 2

Follow up:

Can you do it in $O(n)$ time?

Credits:

Special thanks to @agave and @StefanPochmann for adding this problem and creating all test cases."

377. Combination Sum IV <https://leetcode.com/problems/combination-sum-iv> "Given a n integer array with all positive numbers and no duplicates, find the number of possible combinations that add up to a positive integer target.

Example:

nums = [1, 2, 3]

target = 4

The possible combination ways are:

(1, 1, 1, 1)

(1, 1, 2)

(1, 2, 1)

(1, 3)

(2, 1, 1)

(2, 2)

(3, 1)

Note that different sequences are counted as different combinations.

Therefore the output is 7.

Follow up:

What if negative numbers are allowed in the given array?

How does it change the problem?

What limitation we need to add to the question to allow negative numbers?

Credits:

Special thanks to @pbrother for adding this problem and creating all test cases."

378. Kth Smallest Element in a Sorted Matrix <https://leetcode.com/problems/kth-smallest-element-in-a-sorted-matrix> "Given a n x n matrix where each of the rows and columns are sorted in ascending order, find the kth smallest element in the matrix.

Note that it is the kth smallest element in the sorted order, not the kth distinct element.

Example:

```
matrix = [
  [ 1, 5, 9],
  [10, 11, 13],
  [12, 13, 15]
```

```
],
```

```
k = 8,
```

```
return 13.
```

Note:

You may assume k is always valid, $1 \leq k \leq n/2$.
 380. Insert Delete GetRandom O(1) <https://leetcode.com/problems/insert-delete-getrandom-o1> "Design a data structure that supports all following operations in average O(1) time.

insert(val): Inserts an item val to the set if not already present.
 remove(val): Removes an item val from the set if present.
 getRandom: Returns a random element from current set of elements. Each element must have the same probability of being returned.

Example:

```
// Init an empty set.
RandomizedSet randomSet = new RandomizedSet();

// Inserts 1 to the set. Returns true as 1 was inserted successfully.
randomSet.insert(1);

// Returns false as 2 does not exist in the set.
randomSet.remove(2);

// Inserts 2 to the set, returns true. Set now contains [1,2].
randomSet.insert(2);

// getRandom should return either 1 or 2 randomly.
randomSet.getRandom();

// Removes 1 from the set, returns true. Set now contains [2].
randomSet.remove(1);

// 2 was already in the set, so return false.
randomSet.insert(2);

// Since 2 is the only number in the set, getRandom always return 2.
randomSet.getRandom();"
```

381. Insert Delete GetRandom O(1) - Duplicates allowed <https://leetcode.com/problems/insert-delete-getrandom-o1-duplicates-allowed> "Design a data structure that supports all following operations in average O(1) time.
 Note: Duplicate elements are allowed.

insert(val): Inserts an item val to the collection.
 remove(val): Removes an item val from the collection if present.
 getRandom: Returns a random element from current collection of elements. The probability of each element being returned is linearly related to the number of same value the collection contains.

Example:

```
// Init an empty collection.
RandomizedCollection collection = new RandomizedCollection();

// Inserts 1 to the collection. Returns true as the collection did not contain 1.
collection.insert(1);

// Inserts another 1 to the collection. Returns false as the collection contained 1.
// Collection now contains [1,1].
collection.insert(1);

// Inserts 2 to the collection, returns true. Collection now contains [1,1,2].
collection.insert(2);

// getRandom should return 1 with the probability 2/3, and returns 2 with the probability 1/3.
collection.getRandom();

// Removes 1 from the collection, returns true. Collection now contains [1,2].
```

```
collection.remove(1);

// getRandom should return 1 and 2 both equally likely.
collection.getRandom();"
382. Linked List Random Node https://leetcode.com/problems/linked-list-random-node
    "Given a singly linked list, return a random node's value from the linked list.
    Each node must have the same probability of being chosen."
```

Follow up:

What if the linked list is extremely large and its length is unknown to you? Could you solve this efficiently without using extra space?

Example:

```
// Init a singly linked list [1,2,3].
ListNode head = new ListNode(1);
head.next = new ListNode(2);
head.next.next = new ListNode(3);
Solution solution = new Solution(head);

// getRandom() should return either 1, 2, or 3 randomly. Each element should have equal probability of returning.
solution.getRandom();"
383. Ransom Note https://leetcode.com/problems/ransom-note
    "Given an arbitrary ransom note string and another string containing letters from all the magazines, write a function that will return true if the ransom note can be constructed from the magazines ; otherwise, it will return false."
```

Each letter in the magazine string can only be used once in your ransom note.

Note:

You may assume that both strings contain only lowercase letters.

```
canConstruct("a", "b") -> false
canConstruct("aa", "ab") -> false
canConstruct("aa", "aab") -> true"
384. Shuffle an Array https://leetcode.com/problems/shuffle-an-array
    "Shuffle a set of numbers without duplicates."
```

Example:

```
// Init an array with set 1, 2, and 3.
int[] nums = {1,2,3};
Solution solution = new Solution(nums);

// Shuffle the array [1,2,3] and return its result. Any permutation of [1,2,3] must be equally likely to be returned.
solution.shuffle();

// Resets the array back to its original configuration [1,2,3].
solution.reset();

// Returns the random shuffling of array [1,2,3].
solution.shuffle();"
385. Mini Parser https://leetcode.com/problems/mini-parser
    "Given a nested list of integers represented as a string, implement a parser to deserialize it."
```

Each element is either an integer, or a list -- whose elements may also be integers or other lists.

Note:

You may assume that the string is well-formed:

String is non-empty.
 String does not contain white spaces.
 String contains only digits 0-9, [, - , ,].

Example 1:
Given s = "324",

You should return a NestedInteger object which contains a single integer 324.

Example 2:
Given s = "[123,[456,[789]]]",

Return a NestedInteger object containing a nested list with 2 elements:

1. An integer containing value 123.
 2. A nested list containing two elements:
 - i. An integer containing value 456.
 - ii. A nested list with one element:
 - a. An integer containing value 789.
386. Lexicographical Numbers <https://leetcode.com/problems/lexicographical-number>
s "Given an integer n, return 1 - n in lexicographical order.

For example, given 13, return: [1,10,11,12,13,2,3,4,5,6,7,8,9].

Please optimize your algorithm to use less time and space. The input size may be as large as 5,000,000."

387. First Unique Character in a String <https://leetcode.com/problems/first-unique-character-in-a-string> "Given a string, find the first non-repeating character in it and return it's index. If it doesn't exist, return -1.

Examples:
s = "leetcode"
return 0.

s = "loveleetcode",
return 2.

Note: You may assume the string contain only lowercase letters."

388. Longest Absolute File Path <https://leetcode.com/problems/longest-absolute-file-path> "Suppose we abstract our file system by a string in the following manner:

The string "dir\n\tsubdir1\n\tsubdir2\n\t\tfile.ext" represents:

```
dir
  subdir1
  subdir2
    file.ext
```

The directory dir contains an empty sub-directory subdir1 and a sub-directory subdir2 containing a file file.ext.

The string "dir\n\tsubdir1\n\t\tfile1.ext\n\t\t\tsubsubdir1\n\tsubdir2\n\t\t\tsubsubdir2\n\t\t\t\tfile2.ext" represents:

```
dir
  subdir1
    file1.ext
    subsubdir1
  subdir2
    subsubdir2
      file2.ext
```

The directory dir contains two sub-directories subdir1 and subdir2. subdir1 contains a file file1.ext and an empty second-level sub-directory subsubdir1. subdir2 contains a second-level sub-directory subsubdir2 containing a file file2.ext.

We are interested in finding the longest (number of characters) absolute path to a file within our file system. For example, in the second example above, the longest absolute path is `"dir/subdir2/subsubdir2/file2.ext"`, and its length is 32 (not including the double quotes).

Given a string representing the file system in the above format, return the length of the longest absolute path to file in the abstracted file system. If there is no file in the system, return 0.

Note:

The name of a file contains at least a `.` and an extension.
The name of a directory or sub-directory will not contain a `..`

Time complexity required: $O(n)$ where n is the size of the input string.

Notice that `a/aa/aaa/file1.txt` is not the longest file path, if there is another path `aaaaaaaaaaaaaaaaaaaa/sth.png`.

389. Find the Difference <https://leetcode.com/problems/find-the-difference> "Given two strings `s` and `t` which consist of only lowercase letters.

String `t` is generated by random shuffling string `s` and then add one more letter at a random position.

Find the letter that was added in `t`.

Example:

Input:

`s = "abcd"`

`t = "abcde"`

Output:

`e`

Explanation:

`'e'` is the letter that was added."

390. Elimination Game <https://leetcode.com/problems/elimination-game> "There is a list of sorted integers from 1 to n . Starting from left to right, remove the first number and every other number afterward until you reach the end of the list.

Repeat the previous step again, but this time from right to left, remove the right most number and every other number from the remaining numbers.

We keep repeating the steps again, alternating left to right and right to left, until a single number remains.

Find the last number that remains starting with a list of length n .

Example:

Input:

`n = 9,`

`1 2 3 4 5 6 7 8 9`

`2 4 6 8`

`2 6`

`6`

Output:

`6"`

391. Perfect Rectangle <https://leetcode.com/problems/perfect-rectangle> :

391. Perfect Rectangle <https://leetcode.com/problems/perfect-rectangle> :

391. Perfect Rectangle <https://leetcode.com/problems/perfect-rectangle> :

391. Perfect Rectangle <https://leetcode.com/problems/perfect-rectangle> "Given N axis-aligned rectangles where $N > 0$, determine if they all together form an exact cover of a rectangular region.

Each rectangle is represented as a bottom-left point and a top-right point. For example, a unit square is represented as `[1,1,2,2]`. (coordinate of bottom-left point is

(1, 1) and top-right point is (2, 2)).

Example 1:

```
rectangles = [
    [1,1,3,3],
    [3,1,4,2],
    [3,2,4,4],
    [1,3,2,4],
    [2,3,3,4]
]
```

Return true. All 5 rectangles together form an exact cover of a rectangular region.

Example 2:

```
rectangles = [
    [1,1,2,3],
    [1,3,2,4],
    [3,1,4,2],
    [3,2,4,4]
]
```

Return false. Because there is a gap between the two rectangular regions.

Example 3:

```
rectangles = [
    [1,1,3,3],
    [3,1,4,2],
    [1,3,2,4],
    [3,2,4,4]
]
```

Return false. Because there is a gap in the top center.

Example 4:

```
rectangles = [
    [1,1,3,3],
    [3,1,4,2],
    [1,3,2,4],
    [2,2,4,4]
]
```

Return false. Because two of the rectangles overlap with each other."

391. Perfect Rectangle <https://leetcode.com/problems/perfect-rectangle>
 391. Perfect Rectangle <https://leetcode.com/problems/perfect-rectangle>
 391. Perfect Rectangle <https://leetcode.com/problems/perfect-rectangle>
 391. Perfect Rectangle <https://leetcode.com/problems/perfect-rectangle>
 391. Perfect Rectangle <https://leetcode.com/problems/perfect-rectangle>
 392. Is Subsequence <https://leetcode.com/problems/is-subsequence> "Given a string s and a string t, check if s is subsequence of t.

You may assume that there is only lower case English letters in both s and t. t is potentially a very long (length ~ 500,000) string, and s is a short string (<=100).

A subsequence of a string is a new string which is formed from the original string by deleting some (can be none) of the characters without disturbing the relative positions of the remaining characters. (ie, "ace" is a subsequence of "abcde" while "aec" is not).

Example 1:

```
s = "abc", t = "ahbgdc"
```

Return true.

Example 2:

```
s = "axc", t = "ahbgdc"
```

Return false.

Follow up:

If there are lots of incoming S, say S₁, S₂, ... , S_k where k ≥ 1B, and you want to check one by one to see if T has its subsequence. In this scenario, how would you change your code?

Credits:

Special thanks to @pbrother for adding this problem and creating all test cases."393. UTF-8 Validation <https://leetcode.com/problems/utf-8-validation> "A character in UTF8 can be from 1 to 4 bytes long, subjected to the following rules:

For 1-byte character, the first bit is a 0, followed by its unicode code.

For n-bytes character, the first n-bits are all one's, the n+1 bit is 0, followed by n-1 bytes with most significant 2 bits being 10.

This is how the UTF-8 encoding would work:

Char. number range (hexadecimal)	UTF-8 octet sequence (binary)
0000 0000-0000 007F	0xxxxxxx
0000 0080-0000 07FF	110xxxxx 10xxxxxx
0000 0800-0000 FFFF	1110xxxx 10xxxxxx 10xxxxxx
0001 0000-0010 FFFF	11110xxx 10xxxxxx 10xxxxxx 10xxxxxx

Given an array of integers representing the data, return whether it is a valid utf-8 encoding.

Note:

The input is an array of integers. Only the least significant 8 bits of each integer is used to store the data. This means each integer represents only 1 byte of data.

Example 1:

data = [197, 130, 1], which represents the octet sequence: 11000101 10000010 00000001.

Return true.

It is a valid utf-8 encoding for a 2-bytes character followed by a 1-byte character.

Example 2:

data = [235, 140, 4], which represented the octet sequence: 11101011 10001100 00000100.

Return false.

The first 3 bits are all one's and the 4th bit is 0 means it is a 3-bytes character. The next byte is a continuation byte which starts with 10 and that's correct. But the second continuation byte does not start with 10, so it is invalid."¿
 394. Decode String <https://leetcode.com/problems/decode-string> "Given an encoded string, return it's decoded string."

The encoding rule is: $k[\text{encoded_string}]$, where the `encoded_string` inside the square brackets is being repeated exactly k times. Note that k is guaranteed to be a positive integer.

You may assume that the input string is always valid; No extra white spaces, square brackets are well-formed, etc.

Furthermore, you may assume that the original data does not contain any digits and that digits are only for those repeat numbers, k . For example, there won't be input like 3a or 2[4].

Examples:

`s = "3[a]2[bc]"`, return `"aaabcbc"`.

`s = "3[a2[c]]"`, return `"accaccacc"`.

`s = "2[abc]3[cd]ef"`, return `"abcabccdcddcdef"`. "¿

395. Longest Substring with At Least K Repeating Characters <https://leetcode.com/problems/longest-substring-with-at-least-k-repeating-characters> "Find the length of the longest substring T of a given string (consists of lowercase letters only) such that every character in T appears no less than k times."

Example 1:

Input:

`s = "aaabb"`, $k = 3$

Output:

3

The longest substring is `"aaa"`, as 'a' is repeated 3 times.

Example 2:

Input:

`s = "ababbc"`, $k = 2$

Output:

5

The longest substring is `"ababb"`, as 'a' is repeated 2 times and 'b' is repeated 3 times."¿

396. Rotate Function <https://leetcode.com/problems/rotate-function> "Given an array of integers A and let n to be its length."

Assume B_k to be an array obtained by rotating the array A k positions clock-wise, we define a "rotation function" F on A as follow:

$$F(k) = 0 * B_k[0] + 1 * B_k[1] + \dots + (n-1) * B_k[n-1].$$

Calculate the maximum value of $F(0)$, $F(1)$, ..., $F(n-1)$.

Note:

n is guaranteed to be less than 105.

Example:

A = [4, 3, 2, 6]

$F(0) = (0 * 4) + (1 * 3) + (2 * 2) + (3 * 6) = 0 + 3 + 4 + 18 = 25$

$F(1) = (0 * 6) + (1 * 4) + (2 * 3) + (3 * 2) = 0 + 4 + 6 + 6 = 16$

$F(2) = (0 * 2) + (1 * 6) + (2 * 4) + (3 * 3) = 0 + 6 + 8 + 9 = 23$

$F(3) = (0 * 3) + (1 * 2) + (2 * 6) + (3 * 4) = 0 + 2 + 12 + 12 = 26$

So the maximum value of $F(0)$, $F(1)$, $F(2)$, $F(3)$ is $F(3) = 26$.

397. Integer Replacement <https://leetcode.com/problems/integer-replacement> "Given a positive integer n and you can do operations as follow:

If n is even, replace n with n/2.

If n is odd, you can replace n with either n + 1 or n - 1.

What is the minimum number of replacements needed for n to become 1?

Example 1:

Input:

8

Output:

3

Explanation:

8 -> 4 -> 2 -> 1

Example 2:

Input:

7

Output:

4

Explanation:

7 -> 8 -> 4 -> 2 -> 1

or

7 -> 6 -> 3 -> 2 -> 1

398. Random Pick Index <https://leetcode.com/problems/random-pick-index> "Given an array of integers with possible duplicates, randomly output the index of a given target number. You can assume that the given target number must exist in the array.

Note:

The array size can be very large. Solution that uses too much extra space will not pass the judge.

Example:

```
int[] nums = new int[] {1,2,3,3,3};
```

```
Solution solution = new Solution(nums);
```

```
// pick(3) should return either index 2, 3, or 4 randomly. Each index should have equal probability of returning.
```

```
solution.pick(3);
```

```
// pick(1) should return 0. Since in the array only nums[0] is equal to 1.
```

```
solution.pick(1);
```

399. Evaluate Division <https://leetcode.com/problems/evaluate-division> "Equations are given in the format A / B = k, where A and B are variables represented as strings, and k is a real number (floating point number). Given some queries, return the answer

swers. If the answer does not exist, return -1.0.

Example:

```
Given  a / b = 2.0, b / c = 3.0.
queries are:  a / c = ?,  b / a = ?,  a / e = ?,  a / a = ?,  x / x = ? .
return  [6.0, 0.5, -1.0, 1.0, -1.0 ].
```

The input is: `vector<pair<string, string>> equations, vector<double>& values, vector<pair<string, string>> queries`, where `equations.size() == values.size()`, and the values are positive. This represents the equations. Return `vector<double>`.

According to the example above:

```
equations = [ ["a", "b"], ["b", "c"] ],
values = [2.0, 3.0],
queries = [ ["a", "c"], ["b", "a"], ["a", "e"], ["a", "a"], ["x", "x"] ].
```

The input is always valid. You may assume that evaluating the queries will result in no division by zero and there is no contradiction."

400. Nth Digit <https://leetcode.com/problems/nth-digit> "Find the nth digit of the infinite integer sequence 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, ..."

Note:

n is positive and will fit within the range of a 32-bit signed integer (n < 2³¹).

Example 1:

Input:
3

Output:
3

Example 2:

Input:
11

Output:
0

Explanation:

The 11th digit of the sequence 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, ... is a 0, which is part of the number 10."

401. Binary Watch <https://leetcode.com/problems/binary-watch> "A binary watch has 4 LEDs on the top which represent the hours (0-11), and the 6 LEDs on the bottom represent the minutes (0-59). Each LED represents a zero or one, with the least significant bit on the right.

For example, the above binary watch reads "3:25".

Given a non-negative integer n which represents the number of LEDs that are currently on, return all possible times the watch could represent.

Example:

```
Input: n = 1
Return: ["1:00", "2:00", "4:00", "8:00", "0:01", "0:02", "0:04", "0:08", "0:16", "0:32"]
```

Note:

The order of output does not matter.

The hour must not contain a leading zero, for example "01:00" is not valid, it should be "1:00".

The minute must be consist of two digits and may contain a leading zero, for example "10:2" is not valid, it should be "10:02".

402. Remove K Digits <https://leetcode.com/problems/remove-k-digits> "Given a non-negative integer num represented as a string, remove k digits from the number so that the new number is the smallest possible."

Note:

The length of num is less than 10002 and will be $\leq k$.
The given num does not contain any leading zero.

Example 1:

Input: num = "1432219", k = 3

Output: "1219"

Explanation: Remove the three digits 4, 3, and 2 to form the new number 1219 which is the smallest.

Example 2:

Input: num = "10200", k = 1

Output: "200"

Explanation: Remove the leading 1 and the number is 200. Note that the output must not contain leading zeroes.

Example 3:

Input: num = "10", k = 2

Output: "0"

Explanation: Remove all the digits from the number and it is left with nothing which is 0.

403. Frog Jump <https://leetcode.com/problems/frog-jump> "A frog is crossing a river. The river is divided into x units and at each unit there may or may not exist a stone. The frog can jump on a stone, but it must not jump into the water."

Given a list of stones' positions (in units) in sorted ascending order, determine if the frog is able to cross the river by landing on the last stone. Initially, the frog is on the first stone and assume the first jump must be 1 unit.

If the frog's last jump was k units, then its next jump must be either k - 1, k, or k + 1 units. Note that the frog can only jump in the forward direction.

Note:

The number of stones is ≥ 2 and is $< 1,100$.

Each stone's position will be a non-negative integer < 231 .

The first stone's position is always 0.

Example 1:

[0,1,3,5,6,8,12,17]

There are a total of 8 stones.

The first stone at the 0th unit, second stone at the 1st unit, third stone at the 3rd unit, and so on...

The last stone at the 17th unit.

Return true. The frog can jump to the last stone by jumping 1 unit to the 2nd stone, then 2 units to the 3rd stone, then 2 units to the 4th stone, then 3 units to the 6th stone, 4 units to the 7th stone, and 5 units to the 8th stone.

Example 2:

```
[0,1,2,3,4,8,9,11]
```

Return false. There is no way to jump to the last stone as the gap between the 5th and 6th stone is too large."

404. Sum of Left Leaves <https://leetcode.com/problems/sum-of-left-leaves> "Find the sum of all left leaves in a given binary tree."

Example:

```

      3
     /\
    9 20
   /\  \
  15 7

```

There are two left leaves in the binary tree, with values 9 and 15 respectively. Return 24."

405. Convert a Number to Hexadecimal <https://leetcode.com/problems/convert-a-number-to-hexadecimal> "Given an integer, write an algorithm to convert it to hexadecimal. For negative integer, two's complement method is used."

Note:

All letters in hexadecimal (a-f) must be in lowercase.

The hexadecimal string must not contain extra leading 0s. If the number is zero, it is represented by a single zero character '0'; otherwise, the first character in the hexadecimal string will not be the zero character.

The given number is guaranteed to fit within the range of a 32-bit signed integer. You must not use any method provided by the library which converts/formats the number to hex directly.

Example 1:

Input:
26

Output:
"1a"

Example 2:

Input:
-1

Output:
"ffffffff"

406. Queue Reconstruction by Height <https://leetcode.com/problems/queue-reconstruction-by-height> "Suppose you have a random list of people standing in a queue. Each person is described by a pair of integers (h, k), where h is the height of the person and k is the number of people in front of this person who have a height greater than or equal to h. Write an algorithm to reconstruct the queue."

Note:

The number of people is less than 1,100.

Example

Input:
[[7,0], [4,4], [7,1], [5,0], [6,1], [5,2]]

Output:
[[5,0], [7,0], [5,2], [6,1], [4,4], [7,1]]"

407. Trapping Rain Water II <https://leetcode.com/problems/trapping-rain-water-ii> "Given an m x n matrix of positive integers representing the height of each unit cell in a 2D elevation map, compute the volume of water it is able to trap after raining."

Note:

Both m and n are less than 110. The height of each unit cell is greater than 0 and is less than 20,000.

Example:

Given the following 3x6 height map:

```
[
  [1,4,3,1,3,2],
  [3,2,1,3,2,4],
  [2,3,3,2,3,1]
]
```

Return 4.

The above image represents the elevation map `[[1,4,3,1,3,2],[3,2,1,3,2,4],[2,3,3,2,3,1]]` before the rain.

After the rain, water is trapped between the blocks. The total volume of water trapped is 4."

409. Longest Palindrome <https://leetcode.com/problems/longest-palindrome> "Given a string which consists of lowercase or uppercase letters, find the length of the longest palindromes that can be built with those letters.

This is case sensitive, for example "Aa" is not considered a palindrome here.

Note:

Assume the length of given string will not exceed 1,010.

Example:

Input:
"abcccd"

Output:
7

Explanation:

One longest palindrome that can be built is "dccaccd", whose length is 7."

410. Split Array Largest Sum <https://leetcode.com/problems/split-array-largest-sum> "Given an array which consists of non-negative integers and an integer m, you can split the array into m non-empty continuous subarrays. Write an algorithm to minimize the largest sum among these m subarrays.

Note:

If n is the length of array, assume the following constraints are satisfied:

```
1 ≤ n ≤ 1000
1 ≤ m ≤ min(50, n)
```

Examples:

Input:
nums = [7,2,5,10,8]
m = 2

Output:

18

Explanation:

There are four ways to split nums into two subarrays.

The best way is to split it into [7,2,5] and [10,8], where the largest sum among the two subarrays is only 18."

412. Fizz Buzz <https://leetcode.com/problems/fizz-buzz> "Write a program that outputs the string representation of numbers from 1 to n.

But for multiples of three it should output 'Fizz' instead of the number and for the multiples of five output 'Buzz'. For numbers which are multiples of both three and five output 'FizzBuzz'.

Example:

n = 15,

Return:

```
[
  "1",
  "2",
  "Fizz",
  "4",
  "Buzz",
  "Fizz",
  "7",
  "8",
  "Fizz",
  "Buzz",
  "11",
  "Fizz",
  "13",
  "14",
  "FizzBuzz"
]
```

413. Arithmetic Slices <https://leetcode.com/problems/arithmetic-slices> "A sequence of number is called arithmetic if it consists of at least three elements and if the difference between any two consecutive elements is the same.

For example, these are arithmetic sequence:

```
1, 3, 5, 7, 9
7, 7, 7, 7
3, -1, -5, -9
```

The following sequence is not arithmetic. 1, 1, 2, 5, 7

A zero-indexed array A consisting of N numbers is given. A slice of that array is any pair of integers (P, Q) such that $0 \leq P < Q < N$.

A slice (P, Q) of array A is called arithmetic if the sequence:

A[P], A[P + 1], ..., A[Q - 1], A[Q] is arithmetic. In particular, this means that $P + 1 < Q$.

The function should return the number of arithmetic slices in the array A.

Example:

A = [1, 2, 3, 4]

return: 3, for 3 arithmetic slices in A: [1, 2, 3], [2, 3, 4] and [1, 2, 3, 4] itself."

414. Third Maximum Number <https://leetcode.com/problems/third-maximum-number> "Given a non-empty array of integers, return the third maximum number in this array. If it does not exist, return the maximum number. The time complexity must be in O(n).

Example 1:

Input: [3, 2, 1]

Output: 1

Explanation: The third maximum is 1.

Example 2:

Input: [1, 2]

Output: 2

Explanation: The third maximum does not exist, so the maximum (2) is returned instead.

Example 3:

Input: [2, 2, 3, 1]

Output: 1

Explanation: Note that the third maximum here means the third maximum distinct number.

Both numbers with value 2 are both considered as second maximum."

415. Add Strings <https://leetcode.com/problems/add-strings> "Given two non-negative integers num1 and num2 represented as string, return the sum of num1 and num2.

Note:

The length of both num1 and num2 is < 5100 .

Both num1 and num2 contains only digits 0-9.

Both num1 and num2 does not contain any leading zero.

You must not use any built-in BigInteger library or convert the inputs to integer directly."

416. Partition Equal Subset Sum <https://leetcode.com/problems/partition-equal-subset-sum> "Given a non-empty array containing only positive integers, find if the array can be partitioned into two subsets such that the sum of elements in both subsets is equal.

Note:

Each of the array element will not exceed 100.

The array size will not exceed 200.

Example 1:

Input: [1, 5, 11, 5]

Output: true

Explanation: The array can be partitioned as [1, 5, 5] and [11].

Example 2:

Input: [1, 2, 3, 5]

Output: false

Explanation: The array cannot be partitioned into equal sum subsets."

417. Pacific Atlantic Water Flow <https://leetcode.com/problems/pacific-atlantic-water-flow> "Given an $m \times n$ matrix of non-negative integers representing the height of each unit cell in a continent, the "Pacific ocean" touches the left and top edges of the matrix and the "Atlantic ocean" touches the right and bottom edges.

Water can only flow in four directions (up, down, left, or right) from a cell to another one with height equal or lower.

Find the list of grid coordinates where water can flow to both the Pacific and Atlantic

tic ocean.

Note:

The order of returned grid coordinates does not matter.
Both m and n are less than 150.

Example:

Given the following 5x5 matrix:

```
Pacific ~ ~ ~ ~ ~
~ 1 2 2 3 (5) *
~ 3 2 3 (4) (4) *
~ 2 4 (5) 3 1 *
~ (6) (7) 1 4 5 *
~ (5) 1 1 2 4 *
* * * * * Atlantic
```

Return:

[[0, 4], [1, 3], [1, 4], [2, 2], [3, 0], [3, 1], [4, 0]] (positions with parentheses in above matrix)."

419. Battleships in a Board <https://leetcode.com/problems/battleships-in-a-board>

"Given an 2D board, count how many battleships are in it. The battleships are represented with 'X's, empty slots are represented with '.'s. You may assume the following rules:

You receive a valid board, made of only battleships or empty slots.

Battleships can only be placed horizontally or vertically. In other words, they can only be made of the shape 1xN (1 row, N columns) or Nx1 (N rows, 1 column), where N can be of any size.

At least one horizontal or vertical cell separates between two battleships - there are no adjacent battleships.

Example:

```
X..X
...X
...X
```

In the above board there are 2 battleships.

Invalid Example:

```
...X
XXXX
...X
```

This is an invalid board that you will not receive - as battleships will always have a cell separating between them.

Follow up:

Could you do it in one-pass, using only O(1) extra memory and without modifying the value of the board?"

420. Strong Password Checker <https://leetcode.com/problems/strong-password-checker>
r "A password is considered strong if below conditions are all met:

It has at least 6 characters and at most 20 characters.

It must contain at least one lowercase letter, at least one uppercase letter, and at least one digit.

It must NOT contain three repeating characters in a row ("...aaa..." is weak, but "...aa...a..." is strong, assuming other conditions are met).

Write a function strongPasswordChecker(s), that takes a string s as input, and return the MINIMUM change required to make s a strong password. If s is already strong, return 0.

Insertion, deletion or replace of any one character are all considered as one change.

421. Maximum XOR of Two Numbers in an Array <https://leetcode.com/problems/maximum-xor-of-two-numbers-in-an-array> "Given a non-empty array of numbers, $a_0, a_1, a_2, \dots, a_{n-1}$, where $0 \leq a_i < 2^{31}$.

Find the maximum result of $a_i \text{ XOR } a_j$, where $0 \leq i, j < n$.

Could you do this in $O(n)$ runtime?

Example:

Input: [3, 10, 5, 25, 2, 8]

Output: 28

Explanation: The maximum result is $5 \oplus 25 = 28$.

423. Reconstruct Original Digits from English <https://leetcode.com/problems/reconstruct-original-digits-from-english> "Given a non-empty string containing an out-of-order English representation of digits 0-9, output the digits in ascending order.

Note:

Input contains only lowercase English letters.

Input is guaranteed to be valid and can be transformed to its original digits. That means invalid inputs such as "abc" or "zerone" are not permitted.

Input length is less than 50,000.

Example 1:

Input: "owoztneoe"

Output: "012"

Example 2:

Input: "fviefuro"

Output: "45"

424. Longest Repeating Character Replacement <https://leetcode.com/problems/longest-repeating-character-replacement> "Given a string that consists of only uppercase English letters, you can replace any letter in the string with another letter at most k times. Find the length of a longest substring containing all repeating letters you can get after performing the above operations.

Note:

Both the string's length and k will not exceed 104.

Example 1:

Input:

$s = \text{"ABAB"}, k = 2$

Output:

4

Explanation:

Replace the two 'A's with two 'B's or vice versa.

Example 2:

Input:

$s = \text{"AABABBA"}, k = 1$

Output:

4

Explanation:

Replace the one 'A' in the middle with 'B' and form "AABBBBA".

The substring "BBBB" has the longest repeating letters, which is 4."

432. All O`one Data Structure <https://leetcode.com/problems/all-oone-data-structure>
 Implement a data structure supporting the following operations:

Inc(Key) - Inserts a new key with value 1. Or increments an existing key by 1. Key is guaranteed to be a non-empty string.

Dec(Key) - If Key's value is 1, remove it from the data structure. Otherwise decrements an existing key by 1. If the key does not exist, this function does nothing. Key is guaranteed to be a non-empty string.

GetMaxKey() - Returns one of the keys with maximal value. If no element exists, return an empty string "".

GetMinKey() - Returns one of the keys with minimal value. If no element exists, return an empty string "".

Challenge: Perform all these in O(1) time complexity."

433. Minimum Genetic Mutation <https://leetcode.com/problems/minimum-genetic-mutation>
 A gene string can be represented by an 8-character long string, with choices from "A", "C", "G", "T".

Suppose we need to investigate about a mutation (mutation from "start" to "end"), where ONE mutation is defined as ONE single character changed in the gene string.

For example, "AACCGGTT" -> "AACCGGTA" is 1 mutation.

Also, there is a given gene "bank", which records all the valid gene mutations. A gene must be in the bank to make it a valid gene string.

Now, given 3 things - start, end, bank, your task is to determine what is the minimum number of mutations needed to mutate from "start" to "end". If there is no such a mutation, return -1.

Note:

Starting point is assumed to be valid, so it might not be included in the bank.

If multiple mutations are needed, all mutations during in the sequence must be valid.

You may assume start and end string is not the same.

Example 1:

start: "AACCGGTT"

end: "AACCGGTA"

bank: ["AACCGGTA"]

return: 1

Example 2:

start: "AACCGGTT"

end: "AAACGGTA"

bank: ["AACCGGTA", "AACCGCTA", "AAACGGTA"]

return: 2

Example 3:

start: "AAAAACCC"

end: "AACCCCCC"

bank: ["AAAACCCC", "AAACCCCC", "AACCCCCC"]

return: 3"

434. Number of Segments in a String <https://leetcode.com/problems/number-of-segments-in-a-string> "Count the number of segments in a string, where a segment is defined to be a contiguous sequence of non-space characters.

Please note that the string does not contain any non-printable characters.

Example:

Input: "Hello, my name is John"

Output: 5

435. Non-overlapping Intervals <https://leetcode.com/problems/non-overlapping-intervals> "Given a collection of intervals, find the minimum number of intervals you need to remove to make the rest of the intervals non-overlapping.

Note:

You may assume the interval's end point is always bigger than its start point. Intervals like [1,2] and [2,3] have borders "touching" but they don't overlap each other.

Example 1:

Input: [[1,2], [2,3], [3,4], [1,3]]

Output: 1

Explanation: [1,3] can be removed and the rest of intervals are non-overlapping.

Example 2:

Input: [[1,2], [1,2], [1,2]]

Output: 2

Explanation: You need to remove two [1,2] to make the rest of intervals non-overlapping.

Example 3:

Input: [[1,2], [2,3]]

Output: 0

Explanation: You don't need to remove any of the intervals since they're already non-overlapping.

436. Find Right Interval <https://leetcode.com/problems/find-right-interval> "Given a set of intervals, for each of the interval i, check if there exists an interval j whose start point is bigger than or equal to the end point of the interval i, which can be called that j is on the "right" of i.

For any interval i, you need to store the minimum interval j's index, which means that at the interval j has the minimum start point to build the "right" relationship for interval i. If the interval j doesn't exist, store -1 for the interval i. Finally, you need output the stored value of each interval as an array.

Note:

You may assume the interval's end point is always bigger than its start point. You may assume none of these intervals have the same start point.

Example 1:

Input: [[1,2]]

Output: [-1]

Explanation: There is only one interval in the collection, so it outputs -1.

Example 2:

Input: [[3,4], [2,3], [1,2]]

Output: [-1, 0, 1]

Explanation: There is no satisfied "right" interval for [3,4].
For [2,3], the interval [3,4] has minimum-"right" start point;
For [1,2], the interval [2,3] has minimum-"right" start point.

Example 3:

Input: [[1,4], [2,3], [3,4]]

Output: [-1, 2, -1]

Explanation: There is no satisfied "right" interval for [1,4] and [3,4].
For [2,3], the interval [3,4] has minimum-"right" start point."

437. Path Sum III <https://leetcode.com/problems/path-sum-iii> "You are given a binary tree in which each node contains an integer value.

Find the number of paths that sum to a given value.

The path does not need to start or end at the root or a leaf, but it must go downwards (traveling only from parent nodes to child nodes).

The tree has no more than 1,000 nodes and the values are in the range -1,000,000 to 1,000,000.

Example:

root = [10,5,-3,3,2,null,11,3,-2,null,1], sum = 8

Return 3. The paths that sum to 8 are:

1. 5 -> 3
2. 5 -> 2 -> 1
3. -3 -> 11"

438. Find All Anagrams in a String <https://leetcode.com/problems/find-all-anagrams-in-a-string> "Given a string s and a non-empty string p, find all the start indices of p's anagrams in s.

Strings consists of lowercase English letters only and the length of both strings s and p will not be larger than 20,100.

The order of output does not matter.

Example 1:

Input:

s: "cbaebabacd" p: "abc"

Output:

[0, 6]

Explanation:

The substring with start index = 0 is "cba", which is an anagram of "abc".
The substring with start index = 6 is "bac", which is an anagram of "abc".

Example 2:

Input:

s: "abab" p: "ab"

Output:

[0, 1, 2]

Explanation:

The substring with start index = 0 is "ab", which is an anagram of "ab".
The substring with start index = 1 is "ba", which is an anagram of "ab".
The substring with start index = 2 is "ab", which is an anagram of "ab".
440. K-th Smallest in Lexicographical Order <https://leetcode.com/problems/k-th-smallest-in-lexicographical-order> "Given integers n and k, find the lexicographically k-th smallest integer in the range from 1 to n."

Note: 1 ≤ k ≤ n ≤ 10⁹.

Example:

Input:

n: 13 k: 2

Output:

10

Explanation:

The lexicographical order is [1, 10, 11, 12, 13, 2, 3, 4, 5, 6, 7, 8, 9], so the second smallest number is 10."

441. Arranging Coins <https://leetcode.com/problems/arranging-coins> "You have a total of n coins that you want to form in a staircase shape, where every k-th row must have exactly k coins."

Given n, find the total number of full staircase rows that can be formed.

n is a non-negative integer and fits within the range of a 32-bit signed integer.

Example 1:

n = 5

The coins can form the following rows:

```

x
x x
x x x

```

Because the 3rd row is incomplete, we return 2.

Example 2:

n = 8

The coins can form the following rows:

```

x
x x
x x x
x x x x

```

Because the 4th row is incomplete, we return 3."

442. Find All Duplicates in an Array <https://leetcode.com/problems/find-all-duplicates-in-an-array> "Given an array of integers, 1 ≤ a[i] ≤ n (n = size of array), some elements appear twice and others appear once."

Find all the elements that appear twice in this array.

Could you do it without extra space and in O(n) runtime?

Example:

Input:
[4,3,2,7,8,2,3,1]

Output:
[2,3]"?
443. String Compression <https://leetcode.com/problems/string-compression> "Given a
n array of characters, compress it in-place.

The length after compression must always be smaller than or equal to the original array.

Every element of the array should be a character (not int) of length 1.

After you are done modifying the input array in-place, return the new length of the array.

Follow up:

Could you solve it using only O(1) extra space?

Example 1:

Input:
["a","a","b","b","c","c","c"]

Output:
Return 6, and the first 6 characters of the input array should be: ["a","2","b","","2","c","3"]

Explanation:
"aa" is replaced by "a2". "bb" is replaced by "b2". "ccc" is replaced by "c3".

Example 2:

Input:
["a"]

Output:
Return 1, and the first 1 characters of the input array should be: ["a"]

Explanation:
Nothing is replaced.

Example 3:

Input:
["a","b","b","b","b","b","b","b","b","b","b","b","b","b"]

Output:
Return 4, and the first 4 characters of the input array should be: ["a","b","1","2"].

Explanation:
Since the character "a" does not repeat, it is not compressed. "bbbbbbbbbbbb" is replaced by "b12".
Notice each digit has it's own entry in the array.

Note:

All characters have an ASCII value in [35, 126].

1 <= len(chars) <= 1000."

445. Add Two Numbers II <https://leetcode.com/problems/add-two-numbers-ii> "You are given two non-empty linked lists representing two non-negative integers. The most significant digit comes first and each of their nodes contain a single digit. Add the two numbers and return it as a linked list.

You may assume the two numbers do not contain any leading zero, except the number 0 itself.

Follow up:

What if you cannot modify the input lists? In other words, reversing the lists is not allowed.

Example:

Input: (7 -> 2 -> 4 -> 3) + (5 -> 6 -> 4)

Output: 7 -> 8 -> 0 -> 7"

446. Arithmetic Slices II - Subsequence <https://leetcode.com/problems/arithmetic-slices-ii-subsequence> "A sequence of numbers is called arithmetic if it consists of at least three elements and if the difference between any two consecutive elements is the same.

For example, these are arithmetic sequences:

1, 3, 5, 7, 9

7, 7, 7, 7

3, -1, -5, -9

The following sequence is not arithmetic. 1, 1, 2, 5, 7

A zero-indexed array A consisting of N numbers is given. A subsequence slice of that array is any sequence of integers (P0, P1, ..., Pk) such that 0 ≤ P0 < P1 < ... < Pk < N.

A subsequence slice (P0, P1, ..., Pk) of array A is called arithmetic if the sequence A[P0], A[P1], ..., A[Pk-1], A[Pk] is arithmetic. In particular, this means that k ≥ 2.

The function should return the number of arithmetic subsequence slices in the array A.

The input contains N integers. Every integer is in the range of -231 and 231-1 and 0 ≤ N ≤ 1000. The output is guaranteed to be less than 231-1.

Example:

Input: [2, 4, 6, 8, 10]

Output: 7

Explanation:

All arithmetic subsequence slices are:

[2,4,6]

[4,6,8]

[6,8,10]

[2,4,6,8]

[4,6,8,10]

[2,4,6,8,10]

[2,6,10]"

447. Number of Boomerangs <https://leetcode.com/problems/number-of-boomerangs> "Given n points in the plane that are all pairwise distinct, a "boomerang" is a tuple of points (i, j, k) such that the distance between i and j equals the distance between i and k (the order of the tuple matters).

Find the number of boomerangs. You may assume that n will be at most 500 and coordinates of points are all in the range [-10000, 10000] (inclusive).

Example:

Input:
[[0,0],[1,0],[2,0]]

Output:
2

Explanation:

The two boomerangs are [[1,0],[0,0],[2,0]] and [[1,0],[2,0],[0,0]]"
448. Find All Numbers Disappeared in an Array <https://leetcode.com/problems/find-all-numbers-disappeared-in-an-array> "Given an array of integers where $1 \leq a[i] \leq n$ (n = size of array), some elements appear twice and others appear once.

Find all the elements of $[1, n]$ inclusive that do not appear in this array.

Could you do it without extra space and in $O(n)$ runtime? You may assume the returned list does not count as extra space.

Example:

Input:
[4,3,2,7,8,2,3,1]

Output:
[5,6]"

449. Serialize and Deserialize BST <https://leetcode.com/problems/serialize-and-deserialize-bst> "Serialization is the process of converting a data structure or object into a sequence of bits so that it can be stored in a file or memory buffer, or transmitted across a network connection link to be reconstructed later in the same or another computer environment.

Design an algorithm to serialize and deserialize a binary search tree. There is no restriction on how your serialization/deserialization algorithm should work. You just need to ensure that a binary search tree can be serialized to a string and this string can be deserialized to the original tree structure.

The encoded string should be as compact as possible.

Note: Do not use class member/global/static variables to store states. Your serialize and deserialize algorithms should be stateless."

450. Delete Node in a BST <https://leetcode.com/problems/delete-node-in-a-bst> "Given a root node reference of a BST and a key, delete the node with the given key in the BST. Return the root node reference (possibly updated) of the BST.

Basically, the deletion can be divided into two stages:

Search for a node to remove.
If the node is found, delete the node.

Note: Time complexity should be $O(\text{height of tree})$.

Example:
root = [5,3,6,2,4,null,7]
key = 3

Given key to delete is 3. So we find the node with value 3 and delete it.

One valid answer is [5,4,6,2,null,null,7], shown in the following BST.

Another valid answer is [5,2,6,null,4,null,7].

451. Sort Characters By Frequency <https://leetcode.com/problems/sort-characters-by-frequency> "Given a string, sort it in decreasing order based on the frequency of characters."

Example 1:

Input:
"tree"

Output:
"eert"

Explanation:

'e' appears twice while 'r' and 't' both appear once. So 'e' must appear before both 'r' and 't'. Therefore "eetr" is also a valid answer.

Example 2:

Input:
"cccaaa"

Output:
"cccaaa"

Explanation:

Both 'c' and 'a' appear three times, so "aaaccc" is also a valid answer. Note that "cacaca" is incorrect, as the same characters must be together.

Example 3:

Input:
"Aabb"

Output:
"bbAa"

Explanation:

"bbaA" is also a valid answer, but "Aabb" is incorrect.

Note that 'A' and 'a' are treated as two different characters.

452. Minimum Number of Arrows to Burst Balloons <https://leetcode.com/problems/minimum-number-of-arrows-to-burst-balloons> "There are a number of spherical balloons spread in two-dimensional space. For each balloon, provided input is the start and end coordinates of the horizontal diameter. Since it's horizontal, y-coordinates don't matter and hence the x-coordinates of start and end of the diameter suffice. Start is always smaller than end. There will be at most 104 balloons.

An arrow can be shot up exactly vertically from different points along the x-axis. A balloon with xstart and xend bursts by an arrow shot at x if xstart ≤ x ≤ xend. There is no limit to the number of arrows that can be shot. An arrow once shot keeps travelling up infinitely. The problem is to find the minimum number of arrows that must be shot to burst all balloons.

Example:

Input:
[[10,16], [2,8], [1,6], [7,12]]

Output:
2

Explanation:

One way is to shoot one arrow for example at $x = 6$ (bursting the balloons $[2,8]$ and $[1,6]$) and another arrow at $x = 11$ (bursting the other two balloons)."¿
 453. Minimum Moves to Equal Array Elements <https://leetcode.com/problems/minimum-moves-to-equal-array-elements> "Given a non-empty integer array of size n , find the minimum number of moves required to make all array elements equal, where a move is incrementing $n - 1$ elements by 1.

Example:

Input:

$[1,2,3]$

Output:

3

Explanation:

Only three moves are needed (remember each move increments two elements):

$[1,2,3] \Rightarrow [2,3,3] \Rightarrow [3,4,3] \Rightarrow [4,4,4]$ "¿

454. 4Sum II <https://leetcode.com/problems/4sum-ii> "Given four lists A, B, C, D of integer values, compute how many tuples (i, j, k, l) there are such that $A[i] + B[j] + C[k] + D[l]$ is zero.

To make problem a bit easier, all A, B, C, D have same length of N where $0 \leq N \leq 500$. All integers are in the range of -228 to $228 - 1$ and the result is guaranteed to be at most $231 - 1$.

Example:

Input:

A = $[1, 2]$

B = $[-2, -1]$

C = $[-1, 2]$

D = $[0, 2]$

Output:

2

Explanation:

The two tuples are:

1. $(0, 0, 0, 1) \rightarrow A[0] + B[0] + C[0] + D[1] = 1 + (-2) + (-1) + 2 = 0$

2. $(1, 1, 0, 0) \rightarrow A[1] + B[1] + C[0] + D[0] = 2 + (-1) + (-1) + 0 = 0$ "¿

455. Assign Cookies <https://leetcode.com/problems/assign-cookies> "Assume you are an awesome parent and want to give your children some cookies. But, you should give each child at most one cookie. Each child i has a greed factor g_i , which is the minimum size of a cookie that the child will be content with; and each cookie j has a size s_j . If $s_j \geq g_i$, we can assign the cookie j to the child i , and the child i will be content. Your goal is to maximize the number of your content children and output the maximum number.

Note:

You may assume the greed factor is always positive.

You cannot assign more than one cookie to one child.

Example 1:

Input: $[1,2,3], [1,1]$

Output: 1

Explanation: You have 3 children and 2 cookies. The greed factors of 3 children are 1, 2, 3.

And even though you have 2 cookies, since their size is both 1, you could only make the child whose greed factor is 1 content.

You need to output 1.

Example 2:

Input: $[1,2], [1,2,3]$

Output: 2

Explanation: You have 2 children and 3 cookies. The greed factors of 2 children are 1, 2.

You have 3 cookies and their sizes are big enough to gratify all of the children, You need to output 2."

456. 132 Pattern <https://leetcode.com/problems/132-pattern> "Given a sequence of n integers a_1, a_2, \dots, a_n , a 132 pattern is a subsequence a_i, a_j, a_k such that $i < j < k$ and $a_i < a_k < a_j$. Design an algorithm that takes a list of n numbers as input and checks whether there is a 132 pattern in the list.

Note: n will be less than 15,000.

Example 1:

Input: [1, 2, 3, 4]

Output: False

Explanation: There is no 132 pattern in the sequence.

Example 2:

Input: [3, 1, 4, 2]

Output: True

Explanation: There is a 132 pattern in the sequence: [1, 4, 2].

Example 3:

Input: [-1, 3, 2, 0]

Output: True

Explanation: There are three 132 patterns in the sequence: [-1, 3, 2], [-1, 3, 0] and [-1, 2, 0]."

457. Circular Array Loop <https://leetcode.com/problems/circular-array-loop> "You are given an array of positive and negative integers. If a number n at an index is positive, then move forward n steps. Conversely, if it's negative (-n), move backward n steps. Assume the first element of the array is forward next to the last element, and the last element is backward next to the first element. Determine if there is a loop in this array. A loop starts and ends at a particular index with more than 1 element along the loop. The loop must be "forward" or "backward".

Example 1:

Given the array [2, -1, 1, 2, 2], there is a loop, from index 0 -> 2 -> 3 -> 0.

Example 2:

Given the array [-1, 2], there is no loop.

Note:

The given array is guaranteed to contain no element "0".

Can you do it in $O(n)$ time complexity and $O(1)$ space complexity?"

458. Poor Pigs <https://leetcode.com/problems/poor-pigs> "There are 1000 buckets, one and only one of them contains poison, the rest are filled with water. They all look the same. If a pig drinks that poison it will die within 15 minutes. What is the minimum amount of pigs you need to figure out which bucket contains the poison within one hour.

Answer this question, and write an algorithm for the follow-up general case.

Follow-up:

If there are n buckets and a pig drinking poison will die within m minutes, how many pigs (x) you need to figure out the "poison" bucket within p minutes? There is exactly one bucket with poison."

459. Repeated Substring Pattern <https://leetcode.com/problems/repeated-substring-pattern> "Given a non-empty string check if it can be constructed by taking a substring of it and appending multiple copies of the substring together. You may assume the given string consists of lowercase English letters only and its length will not exceed 10000.

Example 1:

Input: "abab"

Output: True

Explanation: It's the substring "ab" twice.

Example 2:

Input: "aba"

Output: False

Example 3:

Input: "abcabcabcabc"

Output: True

Explanation: It's the substring "abc" four times. (And the substring "abcabc" twice.)"

460. LFU Cache <https://leetcode.com/problems/lfu-cache> "Design and implement a data structure for Least Frequently Used (LFU) cache. It should support the following operations: get and put.

get(key) - Get the value (will always be positive) of the key if the key exists in the cache, otherwise return -1.

put(key, value) - Set or insert the value if the key is not already present. When the cache reaches its capacity, it should invalidate the least frequently used item before inserting a new item. For the purpose of this problem, when there is a tie (i.e., two or more keys that have the same frequency), the least recently used key would be evicted.

Follow up:

Could you do both operations in $O(1)$ time complexity?

Example:

```
LFUCache cache = new LFUCache( 2 /* capacity */ );
```

```
cache.put(1, 1);
cache.put(2, 2);
cache.get(1);    // returns 1
cache.put(3, 3); // evicts key 2
cache.get(2);    // returns -1 (not found)
```

```

cache.get(3);      // returns 3.
cache.put(4, 4);   // evicts key 1.
cache.get(1);      // returns -1 (not found)
cache.get(3);      // returns 3
cache.get(4);      // returns 4"
461. Hamming Distance  https://leetcode.com/problems/hamming-distance "The Hamming
distance between two integers is the number of positions at which the corresponding
bits are different.

```

Given two integers x and y, calculate the Hamming distance.

Note:

0 ≤ x, y < 2³¹.

Example:

Input: x = 1, y = 4

Output: 2

Explanation:

```

1  (0 0 0 1)
4  (0 1 0 0)
   ^      ^

```

The above arrows point to positions where the corresponding bits are different."

462. Minimum Moves to Equal Array Elements II https://leetcode.com/problems/minimum-moves-to-equal-array-elements-ii "Given a non-empty integer array, find the minimum number of moves required to make all array elements equal, where a move is incrementing a selected element by 1 or decrementing a selected element by 1.

You may assume the array's length is at most 10,000.

Example:

Input:
[1,2,3]

Output:
2

Explanation:

Only two moves are needed (remember each move increments or decrements one element):

[1,2,3] => [2,2,3] => [2,2,2]"

463. Island Perimeter https://leetcode.com/problems/island-perimeter "You are given a map in form of a two-dimensional integer grid where 1 represents land and 0 represents water. Grid cells are connected horizontally/vertically (not diagonally). The grid is completely surrounded by water, and there is exactly one island (i.e., one or more connected land cells). The island doesn't have "lakes" (water inside that isn't connected to the water around the island). One cell is a square with side length 1. The grid is rectangular, width and height don't exceed 100. Determine the perimeter of the island.

Example:

```

[[0,1,0,0],
 [1,1,1,0],
 [0,1,0,0],
 [1,1,0,0]]

```

Answer: 16

Explanation: The perimeter is the 16 yellow stripes in the image below:"

464. Can I Win https://leetcode.com/problems/can-i-win "In the "100 game," two players take turns adding, to a running total, any integer from 1..10. The player who first causes the running total to reach or exceed 100 wins.

What if we change the game so that players cannot re-use integers?

For example, two players might take turns drawing from a common pool of numbers of 1..15 without replacement until they reach a total ≥ 100.

Given an integer maxChoosableInteger and another integer desiredTotal, determine if the first player to move can force a win, assuming both players play optimally.

You can always assume that `maxChoosableInteger` will not be larger than 20 and `desiredTotal` will not be larger than 300.

Example

Input:

`maxChoosableInteger = 10`

`desiredTotal = 11`

Output:

false

Explanation:

No matter which integer the first player choose, the first player will lose.

The first player can choose an integer from 1 up to 10.

If the first player choose 1, the second player can only choose integers from 2 up to 10.

The second player will win by choosing 10 and get a total = 11, which is \geq `desiredTotal`.

Same with other integers chosen by the first player, the second player will always win.

466. Count The Repetitions <https://leetcode.com/problems/count-the-repetitions> "Define $S = [s, n]$ as the string S which consists of n connected strings s . For example, $[\"abc\", 3] = \"abccabccabc\"$.

On the other hand, we define that string s_1 can be obtained from string s_2 if we can remove some characters from s_2 such that it becomes s_1 . For example, \"abc\" can be obtained from \"abdbec\" based on our definition, but it can not be obtained from \"acb be\" .

You are given two non-empty strings s_1 and s_2 (each at most 100 characters long) and two integers $0 \leq n_1 \leq 106$ and $1 \leq n_2 \leq 106$. Now consider the strings S_1 and S_2 , where $S_1 = [s_1, n_1]$ and $S_2 = [s_2, n_2]$. Find the maximum integer M such that $[S_2, M]$ can be obtained from S_1 .

Example:

Input:

`s1 = \"acb\", n1 = 4`

`s2 = \"ab\", n2 = 2`

Return:

2

467. Unique Substrings in Wraparound String <https://leetcode.com/problems/unique-substrings-in-wraparound-string> "Consider the string s to be the infinite wraparound string of $\text{\"abcdefghijklmnopqrstuvwxyz\"}$, so s will look like this: $\text{\"...zabcdefghijklmnopqrstuvwxyzabcdefghijklmnopqrstuvwxyzabcd....\"}$.

Now we have another string p . Your job is to find out how many unique non-empty substrings of p are present in s . In particular, your input is the string p and you need to output the number of different non-empty substrings of p in the string s .

Note: p consists of only lowercase English letters and the size of p might be over 10000.

Example 1:

Input: `\"a\"`

Output: 1

Explanation: Only the substring `\"a\"` of string `\"a\"` is in the string s .

Example 2:

Input: `\"cac\"`

Output: 2

Explanation: There are two substrings `\"a\"`, `\"c\"` of string `\"cac\"` in the string s .

Example 3:

Input: ""zab""

Output: 6

Explanation: There are six substrings ""z"", ""a"", ""b"", ""za"", ""ab"", ""zab"" of string ""zab"" in the string s."

468. Validate IP Address <https://leetcode.com/problems/validate-ip-address> "Write a function to check whether an input string is a valid IPv4 address or IPv6 address or neither."

IPv4 addresses are canonically represented in dot-decimal notation, which consists of four decimal numbers, each ranging from 0 to 255, separated by dots ("".""), e.g., 172.16.254.1;

Besides, leading zeros in the IPv4 is invalid. For example, the address 172.16.254.01 is invalid.

IPv6 addresses are represented as eight groups of four hexadecimal digits, each group representing 16 bits. The groups are separated by colons ("":""). For example, the address 2001:0db8:85a3:0000:0000:8a2e:0370:7334 is a valid one. Also, we could omit some leading zeros among four hexadecimal digits and some low-case characters in the address to upper-case ones, so 2001:db8:85a3:0:0:8A2E:0370:7334 is also a valid IPv6 address(Omit leading zeros and using upper cases).

However, we don't replace a consecutive group of zero value with a single empty group using two consecutive colons (::) to pursue simplicity. For example, 2001:0db8:85a3::8A2E:0370:7334 is an invalid IPv6 address.

Besides, extra leading zeros in the IPv6 is also invalid. For example, the address 02001:0db8:85a3:0000:0000:8a2e:0370:7334 is invalid.

Note:

You may assume there is no extra space or special characters in the input string.

Example 1:

Input: ""172.16.254.1""

Output: ""IPv4""

Explanation: This is a valid IPv4 address, return ""IPv4"".

Example 2:

Input: ""2001:0db8:85a3:0:0:8A2E:0370:7334""

Output: ""IPv6""

Explanation: This is a valid IPv6 address, return ""IPv6"".

Example 3:

Input: ""256.256.256.256""

Output: ""Neither""

Explanation: This is neither a IPv4 address nor a IPv6 address."
 472. Concatenated Words <https://leetcode.com/problems/concatenated-words> "Given a list of words (without duplicates), please write a program that returns all concatenated words in the given list of words. A concatenated word is defined as a string that is comprised entirely of at least two shorter words in the given array.

Example:

Input: ["cat","cats","catsdogcats","dog","dogcatsdog","hippopotamuses","rat","ratcatdogcat"]

Output: ["catsdogcats","dogcatsdog","ratcatdogcat"]

Explanation: "catsdogcats" can be concatenated by "cats", "dog" and "cats";
 "dogcatsdog" can be concatenated by "dog", "cats" and "dog";
 "ratcatdogcat" can be concatenated by "rat", "cat", "dog" and "cat".

Note:

The number of elements of the given array will not exceed 10,000
 The length sum of elements in the given array will not exceed 600,000.
 All the input string will only include lower case letters.
 The returned elements order does not matter."

473. Matchsticks to Square <https://leetcode.com/problems/matchsticks-to-square> "Remember the story of Little Match Girl? By now, you know exactly what matchsticks the little match girl has, please find out a way you can make one square by using up all those matchsticks. You should not break any stick, but you can link them up, and each matchstick must be used exactly one time.

Your input will be several matchsticks the girl has, represented with their stick length. Your output will either be true or false, to represent whether you could make one square using all the matchsticks the little match girl has.

Example 1:

Input: [1,1,2,2,2]

Output: true

Explanation: You can form a square with length 2, one side of the square came two sticks with length 1.

Example 2:

Input: [3,3,3,3,4]

Output: false

Explanation: You cannot find a way to form a square with all the matchsticks.

Note:

The length sum of the given matchsticks is in the range of 0 to 10^9 .
 The length of the given matchstick array will not exceed 15."

474. Ones and Zeroes <https://leetcode.com/problems/ones-and-zeroes> "In the computer world, use restricted resource you have to generate maximum benefit is what we always want to pursue.

For now, suppose you are a dominator of m 0s and n 1s respectively. On the other hand, there is an array with strings consisting of only 0s and 1s.

Now your task is to find the maximum number of strings that you can form with given m 0s and n 1s. Each 0 and 1 can be used at most once.

Note:

The given numbers of 0s and 1s will both not exceed 100
The size of given string array won't exceed 600.

Example 1:

Input: Array = {"10", "0001", "111001", "1", "0"}, m = 5, n = 3
Output: 4

Explanation: This are totally 4 strings can be formed by the using of 5 0s and 3 1s, which are 10,0001,11,0

Example 2:

Input: Array = {"10", "0", "1"}, m = 1, n = 1
Output: 2

Explanation: You could form "10", but then you'd have nothing left. Better form "0" and "1".

475. Heaters <https://leetcode.com/problems/heaters> "Winter is coming! Your first job during the contest is to design a standard heater with fixed warm radius to warm all the houses.

Now, you are given positions of houses and heaters on a horizontal line, find out minimum radius of heaters so that all houses could be covered by those heaters.

So, your input will be the positions of houses and heaters separately, and your expected output will be the minimum radius standard of heaters.

Note:

Numbers of houses and heaters you are given are non-negative and will not exceed 2500.

Positions of houses and heaters you are given are non-negative and will not exceed 10^9 .

As long as a house is in the heaters' warm radius range, it can be warmed.

All the heaters follow your radius standard and the warm radius will the same.

Example 1:

Input: [1,2,3],[2]
Output: 1

Explanation: The only heater was placed in the position 2, and if we use the radius 1 standard, then all the houses can be warmed.

Example 2:

Input: [1,2,3,4],[1,4]
Output: 1

Explanation: The two heater was placed in the position 1 and 4. We need to use radius 1 standard, then all the houses can be warmed.

476. Number Complement <https://leetcode.com/problems/number-complement> "Given a positive integer, output its complement number. The complement strategy is to flip the bits of its binary representation.

Note:

The given integer is guaranteed to fit within the range of a 32-bit signed integer. You could assume no leading zero bit in the integer's binary representation.

Example 1:

Input: 5

Output: 2

Explanation: The binary representation of 5 is 101 (no leading zero bits), and its complement is 010. So you need to output 2.

Example 2:

Input: 1

Output: 0

Explanation: The binary representation of 1 is 1 (no leading zero bits), and its complement is 0. So you need to output 0."

477. Total Hamming Distance <https://leetcode.com/problems/total-hamming-distance>

"The Hamming distance between two integers is the number of positions at which the corresponding bits are different.

Now your job is to find the total Hamming distance between all pairs of the given numbers.

Example:

Input: 4, 14, 2

Output: 6

Explanation: In binary representation, the 4 is 0100, 14 is 1110, and 2 is 0010 (just showing the four bits relevant in this case). So the answer will be:

HammingDistance(4, 14) + HammingDistance(4, 2) + HammingDistance(14, 2) = 2 + 2 + 2 = 6.

Note:

Elements of the given array are in the range of 0 to 10^9

Length of the array will not exceed 10^4 ."

479. Largest Palindrome Product <https://leetcode.com/problems/largest-palindrome-product> "Find the largest palindrome made from the product of two n-digit numbers.

Since the result could be very large, you should return the largest palindrome mod 1337.

Example:

Input: 2

Output: 987

Explanation: $99 \times 91 = 9009$, $9009 \% 1337 = 987$

Note:

The range of n is [1,8]."

480. Sliding Window Median <https://leetcode.com/problems/sliding-window-median> "Median is the middle value in an ordered integer list. If the size of the list is even, there is no middle value. So the median is the mean of the two middle value.

Examples:

[2,3,4] , the median is 3

[2,3], the median is $(2 + 3) / 2 = 2.5$

Given an array nums, there is a sliding window of size k which is moving from the very left of the array to the very right. You can only see the k numbers in the window. Each time the sliding window moves right by one position. Your job is to output the median array for each window in the original array.

For example,

Given a non-empty string S and a number K , format the string according to the rules described above.

Example 1:

Input: $S = "5F3Z-2e-9-w"$, $K = 4$

Output: $"5F3Z-2E9W"$

Explanation: The string S has been split into two parts, each part has 4 characters. Note that the two extra dashes are not needed and can be removed.

Example 2:

Input: $S = "2-5g-3-J"$, $K = 2$

Output: $"2-5G-3J"$

Explanation: The string S has been split into three parts, each part has 2 characters except the first part as it could be shorter as mentioned above.

Note:

The length of string S will not exceed 12,000, and K is a positive integer.

String S consists only of alphanumerical characters (a-z and/or A-Z and/or 0-9) and dashes(-).

String S is non-empty."

483. Smallest Good Base <https://leetcode.com/problems/smallest-good-base> "For an integer n , we call $k \geq 2$ a good base of n , if all digits of n base k are 1.

Now given a string representing n , you should return the smallest good base of n in string format.

Example 1:

Input: $"13"$

Output: $"3"$

Explanation: 13 base 3 is 111.

Example 2:

Input: $"4681"$

Output: $"8"$

Explanation: 4681 base 8 is 11111.

Example 3:

Input: $"10000000000000000000"$

Output: $"9999999999999999999"$

Explanation: 10000000000000000000 base 9999999999999999999 is 11.

Note:

The range of n is $[3, 10^{18}]$.

The string representing n is always valid and will not have leading zeros."

485. Max Consecutive Ones <https://leetcode.com/problems/max-consecutive-ones> "Given a binary array, find the maximum number of consecutive 1s in this array.

Example 1:

Input: [1,1,0,1,1,1]

Output: 3

Explanation: The first two digits or the last three digits are consecutive 1s.
The maximum number of consecutive 1s is 3.

Note:

The input array will only contain 0 and 1.

The length of input array is a positive integer and will not exceed 10,000."&
486. Predict the Winner <https://leetcode.com/problems/predict-the-winner> "Given a n array of scores that are non-negative integers. Player 1 picks one of the numbers from either end of the array followed by the player 2 and then player 1 and so on. Each time a player picks a number, that number will not be available for the next player. This continues until all the scores have been chosen. The player with the maximum score wins.

Given an array of scores, predict whether player 1 is the winner. You can assume each player plays to maximize his score.

Example 1:

Input: [1, 5, 2]

Output: False

Explanation: Initially, player 1 can choose between 1 and 2.

If he chooses 2 (or 1), then player 2 can choose from 1 (or 2) and 5. If player 2 chooses 5, then player 1 will be left with 1 (or 2).

So, final score of player 1 is $1 + 2 = 3$, and player 2 is 5.

Hence, player 1 will never be the winner and you need to return False.

Example 2:

Input: [1, 5, 233, 7]

Output: True

Explanation: Player 1 first chooses 1. Then player 2 have to choose between 5 and 7.

No matter which number player 2 choose, player 1 can choose 233.

Finally, player 1 has more score (234) than player 2 (12), so you need to return True representing player1 can win.

Note:

$1 \leq \text{length of the array} \leq 20$.

Any scores in the given array are non-negative integers and will not exceed 10,000,000.

If the scores of both players are equal, then player 1 is still the winner."&

488. Zuma Game <https://leetcode.com/problems/zuma-game> "Think about Zuma Game. You have a row of balls on the table, colored red(R), yellow(Y), blue(B), green(G), and white(W). You also have several balls in your hand.

Each time, you may choose a ball in your hand, and insert it into the row (including the leftmost place and rightmost place). Then, if there is a group of 3 or more balls in the same color touching, remove these balls. Keep doing this until no more balls can be removed.

Find the minimal balls you have to insert to remove all the balls on the table. If you cannot remove all the balls, output -1.

Examples:

Input: "WRRBBW", "RB"

Output: -1

Explanation: WRRBBW -> WRR[R]BBW -> WBBW -> WBB[B]W -> WW

Input: "WRRRBBWW", "WRBRW"

Output: 2

Explanation: WRRRBBWW -> WRRR[R]BBWW -> WWBBWW -> WWBB[B]WW -> WWWW -> empty

Input: "G", "GGGGG"

Output: 2

Explanation: G -> G[G] -> GG[G] -> empty

Input: "RBYBBRRB", "YRBGB"

Output: 3

Explanation: RBYBBRRB -> RBY[Y]BBRRB -> RBBBRRB -> RRRB -> B -> B[B] -> BB[B] -> empty

Note:

You may assume that the initial row of balls on the table won't have any 3 or more consecutive balls with the same color.

The number of balls on the table won't exceed 20, and the string represents these balls is called "board" in the input.

The number of balls in your hand won't exceed 5, and the string represents these balls is called "hand" in the input.

Both input strings will be non-empty and only contain characters 'R','Y','B','G','W'.

491. Increasing Subsequences <https://leetcode.com/problems/increasing-subsequences>
 "Given an integer array, your task is to find all the different possible increasing subsequences of the given array, and the length of an increasing subsequence should be at least 2 .

Example:

Input: [4, 6, 7, 7]

Output: [[4, 6], [4, 7], [4, 6, 7], [4, 6, 7, 7], [6, 7], [6, 7, 7], [7,7], [4,7,7]]

Note:

The length of the given array will not exceed 15.

The range of integer in the given array is [-100,100].

The given array may contain duplicates, and two equal integers should also be considered as a special case of increasing sequence."

492. Construct the Rectangle <https://leetcode.com/problems/construct-the-rectangle>
 "For a web developer, it is very important to know how to design a web page's size. So, given a specific rectangular web page's area, your job by now is to design a rectangular web page, whose length L and width W satisfy the following requirements:
 1. The area of the rectangular web page you designed must equal to the given target area.

2. The width W should not be larger than the length L, which means $L \geq W$.

3. The difference between length L and width W should be as small as possible.

You need to output the length L and the width W of the web page you designed in sequence.

Example:

Input: 4

Output: [2, 2]

Explanation: The target area is 4, and all the possible ways to construct it are [1, 4], [2,2], [4,1].

But according to requirement 2, [1,4] is illegal; according to requirement 3, [4,1] is not optimal compared to [2,2]. So the length L is 2, and the width W is 2.

Note:

The given area won't exceed 10,000,000 and is a positive integer

The web page's width and length you designed must be positive integers."?

493. Reverse Pairs <https://leetcode.com/problems/reverse-pairs> "Given an array `nums`, we call (i, j) an important reverse pair if $i < j$ and $nums[i] > 2 * nums[j]$.

You need to return the number of important reverse pairs in the given array.

Example1:

Input: `[1,3,2,3,1]`

Output: 2

Example2:

Input: `[2,4,3,5,1]`

Output: 3

Note:

The length of the given array will not exceed 50,000.

All the numbers in the input array are in the range of 32-bit integer."?

494. Target Sum <https://leetcode.com/problems/target-sum> "You are given a list of non-negative integers, a_1, a_2, \dots, a_n , and a target, S . Now you have 2 symbols $+$ and $-$. For each integer, you should choose one from $+$ and $-$ as its new symbol.

Find out how many ways to assign symbols to make sum of integers equal to target S .

Example 1:

Input: `nums` is `[1, 1, 1, 1, 1]`, S is 3.

Output: 5

Explanation:

$-1+1+1+1+1 = 3$

$+1-1+1+1+1 = 3$

$+1+1-1+1+1 = 3$

$+1+1+1-1+1 = 3$

$+1+1+1+1-1 = 3$

There are 5 ways to assign symbols to make the sum of `nums` be target 3.

Note:

The length of the given array is positive and will not exceed 20.

The sum of elements in the given array will not exceed 1000.

Your output answer is guaranteed to be fitted in a 32-bit integer."?

495. Teemo Attacking <https://leetcode.com/problems/teemo-attacking> "In LOL world, there is a hero called Teemo and his attacking can make his enemy Ashe be in poisoned condition. Now, given the Teemo's attacking ascending time series towards Ashe and the poisoning time duration per Teemo's attacking, you need to output the total time that Ashe is in poisoned condition.

You may assume that Teemo attacks at the very beginning of a specific time point, and makes Ashe be in poisoned condition immediately.

Example 1:

Input: `[1,4]`, 2

Output: 4

Explanation: At time point 1, Teemo starts attacking Ashe and makes Ashe be poisoned immediately.

This poisoned status will last 2 seconds until the end of time point 2.

And at time point 4, Teemo attacks Ashe again, and causes Ashe to be in poisoned status for another 2 seconds.

So you finally need to output 4.

Example 2:

Input: [1,2], 2

Output: 3

Explanation: At time point 1, Teemo starts attacking Ashe and makes Ashe be poisoned. This poisoned status will last 2 seconds until the end of time point 2. However, at the beginning of time point 2, Teemo attacks Ashe again who is already in poisoned status. Since the poisoned status won't add up together, though the second poisoning attack will still work at time point 2, it will stop at the end of time point 3. So you finally need to output 3.

Note:

You may assume the length of given time series array won't exceed 10000.

You may assume the numbers in the Teemo's attacking time series and his poisoning time duration per attacking are non-negative integers, which won't exceed 10,000,000."

496. Next Greater Element I <https://leetcode.com/problems/next-greater-element-i>
 "You are given two arrays (without duplicates) nums1 and nums2 where nums1's elements are subset of nums2. Find all the next greater numbers for nums1's elements in the corresponding places of nums2."

The Next Greater Number of a number x in nums1 is the first greater number to its right in nums2. If it does not exist, output -1 for this number.

Example 1:

Input: nums1 = [4,1,2], nums2 = [1,3,4,2].

Output: [-1,3,-1]

Explanation:

For number 4 in the first array, you cannot find the next greater number for it in the second array, so output -1.

For number 1 in the first array, the next greater number for it in the second array is 3.

For number 2 in the first array, there is no next greater number for it in the second array, so output -1.

Example 2:

Input: nums1 = [2,4], nums2 = [1,2,3,4].

Output: [3,-1]

Explanation:

For number 2 in the first array, the next greater number for it in the second array is 3.

For number 4 in the first array, there is no next greater number for it in the second array, so output -1.

Note:

All elements in nums1 and nums2 are unique.

The length of both nums1 and nums2 would not exceed 1000."

498. Diagonal Traverse <https://leetcode.com/problems/diagonal-traverse> "Given a matrix of M x N elements (M rows, N columns), return all elements of the matrix in diagonal order as shown in the below image."

Example:

Input:

```
[
  [ 1, 2, 3 ],
  [ 4, 5, 6 ],
  [ 7, 8, 9 ]
]
```

Output: [1,2,4,7,5,3,6,8,9]

Explanation:

Note:

The total number of elements of the given matrix will not exceed 10,000."&
 500. Keyboard Row <https://leetcode.com/problems/keyboard-row> "Given a List of words, return the words that can be typed using letters of alphabet on only one row's of American keyboard like the image below.

Example 1:

Input: ["Hello", "Alaska", "Dad", "Peace"]

Output: ["Alaska", "Dad"]

Note:

You may use one character in the keyboard more than once.
 You may assume the input string will only contain letters of alphabet."&
 501. Find Mode in Binary Search Tree <https://leetcode.com/problems/find-mode-in-binary-search-tree> "Given a binary search tree (BST) with duplicates, find all the mode(s) (the most frequently occurred element) in the given BST.

Assume a BST is defined as follows:

The left subtree of a node contains only nodes with keys less than or equal to the node's key.

The right subtree of a node contains only nodes with keys greater than or equal to the node's key.

Both the left and right subtrees must also be binary search trees.

For example:

Given BST [1,null,2,2],

```

  1
   \
    2
   /
  2

```

return [2].

Note:

If a tree has more than one mode, you can return them in any order.

Follow up:

Could you do that without using any extra space? (Assume that the implicit stack space incurred due to recursion does not count)."

502. IPO <https://leetcode.com/problems/ipo> "Suppose LeetCode will start its IPO soon. In order to sell a good price of its shares to Venture Capital, LeetCode would like to work on some projects to increase its capital before the IPO. Since it has limited resources, it can only finish at most k distinct projects before the IPO. Help LeetCode design the best way to maximize its total capital after finishing at most k distinct projects.

You are given several projects. For each project i, it has a pure profit P_i and a minimum capital of C_i is needed to start the corresponding project. Initially, you have W capital. When you finish a project, you will obtain its pure profit and the profit will be added to your total capital.

To sum up, pick a list of at most k distinct projects from given projects to maximize your final capital, and output your final maximized capital.

Example 1:

Input: k=2, W=0, Profits=[1,2,3], Capital=[0,1,1].

Output: 4

Explanation: Since your initial capital is 0, you can only start the project indexed 0.

After finishing it you will obtain profit 1 and your capital becomes 1.

With capital 1, you can either start the project indexed 1 or the project indexed 2.

Since you can choose at most 2 projects, you need to finish the project indexed 2 to get the maximum capital.

Therefore, output the final maximized capital, which is $0 + 1 + 3 = 4$.

Note:

You may assume all numbers in the input are non-negative integers.

The length of Profits array and Capital array will not exceed 50,000.

The answer is guaranteed to fit in a 32-bit signed integer."

503. Next Greater Element II <https://leetcode.com/problems/next-greater-element-ii> "Given a circular array (the next element of the last element is the first element of the array), print the Next Greater Number for every element. The Next Greater Number of a number x is the first greater number to its traversing-order next in the array, which means you could search circularly to find its next greater number. If it doesn't exist, output -1 for this number.

Example 1:

Input: [1,2,1]

Output: [2,-1,2]

Explanation: The first 1's next greater number is 2;

The number 2 can't find next greater number;

The second 1's next greater number needs to search circularly, which is also 2.

Note:

The length of given array won't exceed 10000."

504. Base 7 <https://leetcode.com/problems/base-7> "Given an integer, return its base 7 string representation.

Example 1:

Input: 100
Output: ""202""

Example 2:

Input: -7
Output: ""-10""

Note:

The input will be in range of $[-1e7, 1e7]$.

506. Relative Ranks <https://leetcode.com/problems/relative-ranks> "Given scores of N athletes, find their relative ranks and the people with the top three highest scores, who will be awarded medals: "Gold Medal", "Silver Medal" and "Bronze Medal".

Example 1:

Input: [5, 4, 3, 2, 1]
Output: ["Gold Medal", "Silver Medal", "Bronze Medal", "4", "5"]
Explanation: The first three athletes got the top three highest scores, so they got "Gold Medal", "Silver Medal" and "Bronze Medal".
For the left two athletes, you just need to output their relative ranks according to their scores.

Note:

N is a positive integer and won't exceed 10,000.

All the scores of athletes are guaranteed to be unique.

507. Perfect Number <https://leetcode.com/problems/perfect-number> "We define the Perfect Number is a positive integer that is equal to the sum of all its positive divisors except itself.

Now, given an integer n, write a function that returns true when it is a perfect number and false when it is not.

Example:

Input: 28
Output: True
Explanation: $28 = 1 + 2 + 4 + 7 + 14$

Note:

The input number n will not exceed 100,000,000. ($1e8$)

508. Most Frequent Subtree Sum <https://leetcode.com/problems/most-frequent-subtree-sum> "Given the root of a tree, you are asked to find the most frequent subtree sum. The subtree sum of a node is defined as the sum of all the node values formed by the subtree rooted at that node (including the node itself). So what is the most frequent subtree sum value? If there is a tie, return all the values with the highest frequency in any order.

Examples 1

Input:

```

  5
 / \
2  -3

```

return [2, -3, 4], since all the values happen only once, return all of them in any order.

Examples 2

Input:

```

  5
 / \
2   -5

```

return [2], since 2 happens twice, however -5 only occur once.

Note:

You may assume the sum of values in any subtree is in the range of 32-bit signed integer."

513. Find Bottom Left Tree Value <https://leetcode.com/problems/find-bottom-left-tree-value> "Given a binary tree, find the leftmost value in the last row of the tree."

Example 1:

Input:

```

  2
 / \
1   3

```

Output:

1

Example 2:

Input:

```

      1
     /\
    2  3
   /\ /\
  4 5 6
     /
    7

```

Output:

7

Note:

You may assume the tree (i.e., the given root node) is not NULL."

514. Freedom Trail <https://leetcode.com/problems/freedom-trail> "In the video game Fallout 4, the quest "Road to Freedom" requires players to reach a metal dial called the "Freedom Trail Ring", and use the dial to spell a specific keyword in order to open the door."

Given a string ring, which represents the code engraved on the outer ring and another string key, which represents the keyword needs to be spelled. You need to find the minimum number of steps in order to spell all the characters in the keyword.

Initially, the first character of the ring is aligned at 12:00 direction. You need to spell all the characters in the string key one by one by rotating the ring clockwise or anticlockwise to make each character of the string key aligned at 12:00 direction and then by pressing the center button.

At the stage of rotating the ring to spell the key character key[i]:

You can rotate the ring clockwise or anticlockwise one place, which counts as 1 step

. The final purpose of the rotation is to align one of the string ring's characters at the 12:00 direction, where this character must equal to the character key[i].

If the character key[i] has been aligned at the 12:00 direction, you need to press the center button to spell, which also counts as 1 step. After the pressing, you could begin to spell the next character in the key (next stage), otherwise, you've finished all the spelling.

Example:

Input: ring = "godding", key = "gd"

Output: 4

Explanation:

For the first key character 'g', since it is already in place, we just need 1 step to spell this character.

For the second key character 'd', we need to rotate the ring "godding" anticlockwise by two steps to make it become "ddinggo".

Also, we need 1 more step for spelling.

So the final output is 4.

Note:

Length of both ring and key will be in range 1 to 100.

There are only lowercase letters in both strings and might be some duplicate characters in both strings.

It's guaranteed that string key could always be spelled by rotating the string ring.

515. Find Largest Value in Each Tree Row <https://leetcode.com/problems/find-largest-value-in-each-tree-row> "You need to find the largest value in each row of a binary tree."

Example:

Input:

Output: [1, 3, 9]

516. Longest Palindromic Subsequence <https://leetcode.com/problems/longest-palindromic-subsequence> "Given a string s, find the longest palindromic subsequence's length in s. You may assume that the maximum length of s is 1000."

Example 1:

Input:

"bbbab"

Output:

4

One possible longest palindromic subsequence is "bbbb".

Example 2:

Input:

"cbbd"

Output:
2

One possible longest palindromic subsequence is ""bb""."

517. Super Washing Machines <https://leetcode.com/problems/super-washing-machines>

"You have n super washing machines on a line. Initially, each washing machine has some dresses or is empty.

For each move, you could choose any m ($1 \leq m \leq n$) washing machines, and pass one dress of each washing machine to one of its adjacent washing machines at the same time.

Given an integer array representing the number of dresses in each washing machine from left to right on the line, you should find the minimum number of moves to make all the washing machines have the same number of dresses. If it is not possible to do it, return -1.

Example1

Input: [1,0,5]

Output: 3

Explanation:

1st move:	1	0	<--	5	=>	1	1	4	
2nd move:	1	<--	1	<--	4	=>	2	1	3
3rd move:	2		1	<--	3	=>	2	2	2

Example2

Input: [0,3,0]

Output: 2

Explanation:

1st move:	0	<--	3		0	=>	1	2	0
2nd move:	1		2	-->	0	=>	1	1	1

Example3

Input: [0,2,0]

Output: -1

Explanation:

It's impossible to make all the three washing machines have the same number of dresses.

Note:

The range of n is [1, 10000].

The range of dresses number in a super washing machine is [0, 1e5]."

518. Coin Change 2 <https://leetcode.com/problems/coin-change-2> "You are given coins of different denominations and a total amount of money. Write a function to compute the number of combinations that make up that amount. You may assume that you have infinite number of each kind of coin.

Note:

You can assume that

0 <= amount <= 5000

1 <= coin <= 5000

the number of coins is less than 500

the answer is guaranteed to fit into signed 32-bit integer

Example 1:
 Input: amount = 5, coins = [1, 2, 5]
 Output: 4
 Explanation: there are four ways to make up the amount:
 5=5
 5=2+2+1
 5=2+1+1+1
 5=1+1+1+1+1

Example 2:
 Input: amount = 3, coins = [2]
 Output: 0
 Explanation: the amount of 3 cannot be made up just with coins of 2.

Example 3:
 Input: amount = 10, coins = [10]
 Output: 1
 520. Detect Capital <https://leetcode.com/problems/detect-capital> "Given a word, you need to judge whether the usage of capitals in it is right or not."

We define the usage of capitals in a word to be right when one of the following cases holds:

All letters in this word are capitals, like "USA".
 All letters in this word are not capitals, like "leetcode".
 Only the first letter in this word is capital if it has more than one letter, like "Google".

Otherwise, we define that this word doesn't use capitals in a right way.

Example 1:
 Input: "USA"
 Output: True

Example 2:
 Input: "FlaG"
 Output: False

Note:
 The input will be a non-empty word consisting of uppercase and lowercase latin letters.
 521. Longest Uncommon Subsequence I <https://leetcode.com/problems/longest-uncommon-subsequence-i> "Given a group of two strings, you need to find the longest uncommon subsequence of this group of two strings.
 The longest uncommon subsequence is defined as the longest subsequence of one of the two strings and this subsequence should not be any subsequence of the other string."

A subsequence is a sequence that can be derived from one sequence by deleting some characters without changing the order of the remaining elements. Trivially, any string is a subsequence of itself and an empty string is a subsequence of any string.

The input will be two strings, and the output needs to be the length of the longest uncommon subsequence. If the longest uncommon subsequence doesn't exist, return -1.

Example 1:

Input: ""aba"", ""cdc""

Output: 3

Explanation: The longest uncommon subsequence is ""aba"" (or ""cdc""), because ""aba"" is a subsequence of ""aba"", but not a subsequence of any other strings in the group of two strings.

Note:

Both strings' lengths will not exceed 100.

Only letters from a ~ z will appear in input strings."

522. Longest Uncommon Subsequence II <https://leetcode.com/problems/longest-uncommon-subsequence-ii> "Given a list of strings, you need to find the longest uncommon subsequence among them. The longest uncommon subsequence is defined as the longest subsequence of one of these strings and this subsequence should not be any subsequence of the other strings.

A subsequence is a sequence that can be derived from one sequence by deleting some characters without changing the order of the remaining elements. Trivially, any string is a subsequence of itself and an empty string is a subsequence of any string.

The input will be a list of strings, and the output needs to be the length of the longest uncommon subsequence. If the longest uncommon subsequence doesn't exist, return -1.

Example 1:

Input: ""aba"", ""cdc"", ""eae""

Output: 3

Note:

All the given strings' lengths will not exceed 10.

The length of the given list will be in the range of [2, 50]."

523. Continuous Subarray Sum <https://leetcode.com/problems/continuous-subarray-sum> "Given a list of non-negative numbers and a target integer k, write a function to check if the array has a continuous subarray of size at least 2 that sums up to the multiple of k, that is, sums up to n*k where n is also an integer.

Example 1:

Input: [23, 2, 4, 6, 7], k=6

Output: True

Explanation: Because [2, 4] is a continuous subarray of size 2 and sums up to 6.

Example 2:

Input: [23, 2, 6, 4, 7], k=6

Output: True

Explanation: Because [23, 2, 6, 4, 7] is a continuous subarray of size 5 and sums up to 42.

Note:

The length of the array won't exceed 10,000.

You may assume the sum of all the numbers is in the range of a signed 32-bit integer."

524. Longest Word in Dictionary through Deleting <https://leetcode.com/problems/longest-word-in-dictionary-through-deleting> "Given a string and a string dictionary, find the longest string in the dictionary that can be formed by deleting some characters of the given string. If there are more than one possible results, return the longest word with the smallest lexicographical order. If there is no possible result, return the empty string.

Example 1:

Input:

s = "abpcplea", d = ["ale", "apple", "monkey", "plea"]

Output:

"apple"

Example 2:

Input:

s = "abpcplea", d = ["a", "b", "c"]

Output:

"a"

Note:

All the strings in the input will only contain lower-case letters.

The size of the dictionary won't exceed 1,000.

The length of all the strings in the input won't exceed 1,000."

525. Contiguous Array <https://leetcode.com/problems/contiguous-array> "Given a binary array, find the maximum length of a contiguous subarray with equal number of 0 and 1.

Example 1:

Input: [0,1]

Output: 2

Explanation: [0, 1] is the longest contiguous subarray with equal number of 0 and 1.

Example 2:

Input: [0,1,0]

Output: 2

Explanation: [0, 1] (or [1, 0]) is a longest contiguous subarray with equal number of 0 and 1.

Note:

The length of the given binary array will not exceed 50,000."

526. Beautiful Arrangement <https://leetcode.com/problems/beautiful-arrangement> "Suppose you have N integers from 1 to N. We define a beautiful arrangement as an array that is constructed by these N numbers successfully if one of the following is true for the ith position (1 ≤ i ≤ N) in this array:

The number at the ith position is divisible by i.

i is divisible by the number at the ith position.

Now given N, how many beautiful arrangements can you construct?

Example 1:

Input: 2
Output: 2
Explanation:

The first beautiful arrangement is [1, 2]:

Number at the 1st position (i=1) is 1, and 1 is divisible by i (i=1).

Number at the 2nd position (i=2) is 2, and 2 is divisible by i (i=2).

The second beautiful arrangement is [2, 1]:

Number at the 1st position (i=1) is 2, and 2 is divisible by i (i=1).

Number at the 2nd position (i=2) is 1, and i (i=2) is divisible by 1.

Note:

N is a positive integer and will not exceed 15."

529. Minesweeper <https://leetcode.com/problems/minesweeper> "Let's play the mine sweeper game (Wikipedia, online game)!"

You are given a 2D char matrix representing the game board. 'M' represents an unrevealed mine, 'E' represents an unrevealed empty square, 'B' represents a revealed blank square that has no adjacent (above, below, left, right, and all 4 diagonals) mines, digit ('1' to '8') represents how many mines are adjacent to this revealed square, and finally 'X' represents a revealed mine.

Now given the next click position (row and column indices) among all the unrevealed squares ('M' or 'E'), return the board after revealing this position according to the following rules:

If a mine ('M') is revealed, then the game is over - change it to 'X'.

If an empty square ('E') with no adjacent mines is revealed, then change it to revealed blank ('B') and all of its adjacent unrevealed squares should be revealed recursively.

If an empty square ('E') with at least one adjacent mine is revealed, then change it to a digit ('1' to '8') representing the number of adjacent mines.

Return the board when no more squares will be revealed.

Example 1:

Input:

```
[['E', 'E', 'E', 'E', 'E'],
 ['E', 'E', 'M', 'E', 'E'],
 ['E', 'E', 'E', 'E', 'E'],
 ['E', 'E', 'E', 'E', 'E']]
```

Click : [3,0]

Output:

```
[['B', '1', 'E', '1', 'B'],
 ['B', '1', 'M', '1', 'B'],
 ['B', '1', '1', '1', 'B'],
 ['B', 'B', 'B', 'B', 'B']]
```

Explanation:

Example 2:

Input:

```
[['B', '1', 'E', '1', 'B'],
 ['B', '1', 'M', '1', 'B'],
 ['B', '1', '1', '1', 'B'],
 ['B', 'B', 'B', 'B', 'B']]
```

Click : [1,2]

Output:

```
[['B', '1', 'E', '1', 'B'],
 ['B', '1', 'X', '1', 'B'],
 ['B', '1', '1', '1', 'B'],
 ['B', 'B', 'B', 'B', 'B']]
```

Explanation:

Note:

The range of the input matrix's height and width is [1,50].
 The click position will only be an unrevealed square ('M' or 'E'), which also means the input board contains at least one clickable square.
 The input board won't be a stage when game is over (some mines have been revealed).
 For simplicity, not mentioned rules should be ignored in this problem. For example, you don't need to reveal all the unrevealed mines when the game is over, consider any cases that you will win the game or flag any squares."
 530. Minimum Absolute Difference in BST <https://leetcode.com/problems/minimum-absolute-difference-in-bst> "Given a binary search tree with non-negative values, find the minimum absolute difference between values of any two nodes."

Example:

Input:

```
  1
   \
    3
   /
  2
```

Output:

1

Explanation:

The minimum absolute difference is 1, which is the difference between 2 and 1 (or between 2 and 3).

Note:

There are at least two nodes in this BST."

532. K-diff Pairs in an Array <https://leetcode.com/problems/k-diff-pairs-in-an-array> "Given an array of integers and an integer k, you need to find the number of unique k-diff pairs in the array. Here a k-diff pair is defined as an integer pair (i, j), where i and j are both numbers in the array and their absolute difference is k."

Example 1:

Input: [3, 1, 4, 1, 5], k = 2

Output: 2

Explanation: There are two 2-diff pairs in the array, (1, 3) and (3, 5).

Although we have two 1s in the input, we should only return the number of unique pairs.

Example 2:

Input: [1, 2, 3, 4, 5], k = 1

Output: 4

Explanation: There are four 1-diff pairs in the array, (1, 2), (2, 3), (3, 4) and (4, 5).

Example 3:

Input: [1, 3, 1, 5, 4], k = 0

Output: 1

Explanation: There is one 0-diff pair in the array, (1, 1).

Note:

The pairs (i, j) and (j, i) count as the same pair.

The length of the array won't exceed 10,000.

All the integers in the given input belong to the range: $[-1e7, 1e7]$."

535. Encode and Decode TinyURL <https://leetcode.com/problems/encode-and-decode-tiny-url> "Note: This is a companion problem to the System Design problem: Design TinyURL.

TinyURL is a URL shortening service where you enter a URL such as <https://leetcode.com/problems/design-tinyurl> and it returns a short URL such as <http://tinyurl.com/4e9iAk>.

Design the encode and decode methods for the TinyURL service. There is no restriction on how your encode/decode algorithm should work. You just need to ensure that a URL can be encoded to a tiny URL and the tiny URL can be decoded to the original URL."

537. Complex Number Multiplication <https://leetcode.com/problems/complex-number-multiplication> "Given two strings representing two complex numbers.

You need to return a string representing their multiplication. Note $i^2 = -1$ according to the definition.

Example 1:

Input: "1+1i", "1+1i"

Output: "0+2i"

Explanation: $(1 + i) * (1 + i) = 1 + i^2 + 2 * i = 2i$, and you need convert it to the form of 0+2i.

Example 2:

Input: "1+-1i", "1+-1i"

Output: "0+-2i"

Explanation: $(1 - i) * (1 - i) = 1 + i^2 - 2 * i = -2i$, and you need convert it to the form of 0+-2i.

Note:

The input strings will not have extra blank.

The input strings will be given in the form of $a+bi$, where the integer a and b will both belong to the range of $[-100, 100]$. And the output should be also in this form."

538. Convert BST to Greater Tree <https://leetcode.com/problems/convert-bst-to-greater-tree> "Given a Binary Search Tree (BST), convert it to a Greater Tree such that every key of the original BST is changed to the original key plus sum of all keys greater than the original key in BST.

Example:

Input: The root of a Binary Search Tree like this:

```

      5
     / \
    2   13

```

Output: The root of a Greater Tree like this:

```

      18
     /  \
    20   13

```

539. Minimum Time Difference <https://leetcode.com/problems/minimum-time-difference>
 "Given a list of 24-hour clock time points in "Hour:Minutes" format, find the minimum minutes difference between any two time points in the list."

Example 1:

Input: ["23:59", "00:00"]

Output: 1

Note:

The number of time points in the given list is at least 2 and won't exceed 20000.

The input time is legal and ranges from 00:00 to 23:59."

540. Single Element in a Sorted Array <https://leetcode.com/problems/single-element-in-a-sorted-array> "Given a sorted array consisting of only integers where every element appears twice except for one element which appears once. Find this single element that appears only once."

Example 1:

Input: [1,1,2,3,3,4,4,8,8]

Output: 2

Example 2:

Input: [3,3,7,7,10,11,11]

Output: 10

Note:

Your solution should run in $O(\log n)$ time and $O(1)$ space."

541. Reverse String II <https://leetcode.com/problems/reverse-string-ii> "Given a string and an integer k, you need to reverse the first k characters for every 2k characters counting from the start of the string. If there are less than k characters left, reverse all of them. If there are less than 2k but greater than or equal to k characters, then reverse the first k characters and left the other as original."

Example:

Input: s = "abcdefg", k = 2

Output: "bacdfeg"

Restrictions:

The string consists of lower English letters only.

Length of the given string and k will in the range [1, 10000]"

542. 01 Matrix <https://leetcode.com/problems/01-matrix> "Given a matrix consists of 0 and 1, find the distance of the nearest 0 for each cell."

The distance between two adjacent cells is 1.

Example 1:

Input:

```
0 0 0
0 1 0
0 0 0
```

Output:

```
0 0 0
0 1 0
0 0 0
```

Example 2:

Input:

```
0 0 0
0 1 0
1 1 1
```

Output:

```
0 0 0
0 1 0
1 2 1
```

Note:

The number of elements of the given matrix will not exceed 10,000.

There are at least one 0 in the given matrix.

The cells are adjacent in only four directions: up, down, left and right."

543. Diameter of Binary Tree <https://leetcode.com/problems/diameter-of-binary-tree>
 "Given a binary tree, you need to compute the length of the diameter of the tree. The diameter of a binary tree is the length of the longest path between any two nodes in a tree. This path may or may not pass through the root."

Example:

Given a binary tree

Return 3, which is the length of the path [4,2,1,3] or [5,2,1,3].

Note:

The length of path between two nodes is represented by the number of edges between them."

546. Remove Boxes <https://leetcode.com/problems/remove-boxes> "Given several boxes with different colors represented by different positive numbers.

You may experience several rounds to remove boxes until there is no box left. Each time you can choose some continuous boxes with the same color (composed of k boxes, k >= 1), remove them and get k*k points.

Find the maximum points you can get.

Example 1:

Input:

```
[1, 3, 2, 2, 2, 3, 4, 3, 1]
```

Output:
23

Explanation:
[1, 3, 2, 2, 2, 3, 4, 3, 1]
----> [1, 3, 3, 4, 3, 1] (3*3=9 points)
----> [1, 3, 3, 3, 1] (1*1=1 points)
----> [1, 1] (3*3=9 points)
----> [] (2*2=4 points)

Note:

The number of boxes n would not exceed 100."?

547. Friend Circles <https://leetcode.com/problems/friend-circles> "There are N students in a class. Some of them are friends, while some are not. Their friendship is transitive in nature. For example, if A is a direct friend of B, and B is a direct friend of C, then A is an indirect friend of C. And we defined a friend circle is a group of students who are direct or indirect friends.

Given a N*N matrix M representing the friend relationship between students in the class. If $M[i][j] = 1$, then the ith and jth students are direct friends with each other, otherwise not. And you have to output the total number of friend circles among all the students.

Example 1:

Input:
[[1,1,0],
 [1,1,0],
 [0,0,1]]
Output: 2
Explanation:The 0th and 1st students are direct friends, so they are in a friend circle.
The 2nd student himself is in a friend circle. So return 2.

Example 2:

Input:
[[1,1,0],
 [1,1,1],
 [0,1,1]]
Output: 1
Explanation:The 0th and 1st students are direct friends, the 1st and 2nd students are direct friends,
so the 0th and 2nd students are indirect friends. All of them are in the same friend circle, so return 1.

Note:

N is in range [1,200].
 $M[i][i] = 1$ for all students.
If $M[i][j] = 1$, then $M[j][i] = 1$."

551. Student Attendance Record I <https://leetcode.com/problems/student-attendance-record-i> "You are given a string representing an attendance record for a student. The record only contains the following three characters:

'A' : Absent.
'L' : Late.
'P' : Present.

A student could be rewarded if his attendance record doesn't contain more than one 'A' (absent) or more than two continuous 'L' (late).

You need to return whether the student could be rewarded according to his attendance record.

Example 1:

Input: "PPALLP"
Output: True

Example 2:

Input: "PPALLL"
Output: False

552. Student Attendance Record II <https://leetcode.com/problems/student-attendance-record-ii> "Given a positive integer n, return the number of all possible attendance records with length n, which will be regarded as rewardable. The answer may be very large, return it after mod 109 + 7.

A student attendance record is a string that only contains the following three characters:

'A' : Absent.
'L' : Late.
'P' : Present.

A record is regarded as rewardable if it doesn't contain more than one 'A' (absent) or more than two continuous 'L' (late).

Example 1:

Input: n = 2
Output: 8
Explanation:
There are 8 records with length 2 will be regarded as rewardable:
"PP", "AP", "PA", "LP", "PL", "AL", "LA", "LL"
Only "AA" won't be regarded as rewardable owing to more than one absent times.

Note:

The value of n won't exceed 100,000.

553. Optimal Division <https://leetcode.com/problems/optimal-division> "Given a list of positive integers, the adjacent integers will perform the float division. For example, [2,3,4] -> 2 / 3 / 4.

However, you can add any number of parenthesis at any position to change the priority of operations. You should find out how to add parenthesis to get the maximum result, and return the corresponding expression in string format. Your expression should NOT contain redundant parenthesis.

Example:

Input: [1000,100,10,2]
Output: "1000/(100/10/2)"
Explanation:
 $1000/(100/10/2) = 1000/((100/10)/2) = 200$
However, the bold parenthesis in "1000/((100/10)/2)" are redundant, since they don't influence the operation priority. So you should return "1000/(100/10/2)".

Other cases:

```

1000/(100/10)/2 = 50
1000/(100/(10/2)) = 50
1000/100/10/2 = 0.5
1000/100/(10/2) = 2

```

Note:

The length of the input array is [1, 10].
 Elements in the given array will be in range [2, 1000].
 There is only one optimal division for each test case."¿
 554. Brick Wall <https://leetcode.com/problems/brick-wall> "There is a brick wall in front of you. The wall is rectangular and has several rows of bricks. The bricks have the same height but different width. You want to draw a vertical line from the top to the bottom and cross the least bricks.

The brick wall is represented by a list of rows. Each row is a list of integers representing the width of each brick in this row from left to right.

If your line goes through the edge of a brick, then the brick is not considered as crossed. You need to find out how to draw the line to cross the least bricks and return the number of crossed bricks.

You cannot draw a line just along one of the two vertical edges of the wall, in which case the line will obviously cross no bricks.

Example:

```

Input:
[[1,2,2,1],
 [3,1,2],
 [1,3,2],
 [2,4],
 [3,1,2],
 [1,3,1,1]]
Output: 2
Explanation:

```

Note:

The width sum of bricks in different rows are the same and won't exceed INT_MAX.
 The number of bricks in each row is in range [1,10,000]. The height of wall is in range [1,10,000]. Total number of bricks of the wall won't exceed 20,000."¿
 556. Next Greater Element III <https://leetcode.com/problems/next-greater-element-iii> "Given a positive 32-bit integer n, you need to find the smallest 32-bit integer which has exactly the same digits existing in the integer n and is greater in value than n. If no such positive 32-bit integer exists, you need to return -1.

Example 1:

```

Input: 12
Output: 21

```

Example 2:

```

Input: 21
Output: -1"¿
557. Reverse Words in a String III https://leetcode.com/problems/reverse-words-in-a-string-iii "Given a string, you need to reverse the order of characters in each word within a sentence while still preserving whitespace and initial word order.

```

Example 1:

Input: "Let's take LeetCode contest"
 Output: "s'teL ekat edoCteeL tsetnoc"

Note:

In the string, each word is separated by single space and there will not be any extra space in the string."

560. Subarray Sum Equals K <https://leetcode.com/problems/subarray-sum-equals-k> "Given an array of integers and an integer k, you need to find the total number of continuous subarrays whose sum equals to k."

Example 1:

Input: nums = [1,1,1], k = 2
 Output: 2

Note:

The length of the array is in range [1, 20,000].

The range of numbers in the array is [-1000, 1000] and the range of the integer k is [-1e7, 1e7]."

561. Array Partition I <https://leetcode.com/problems/array-partition-i> "Given an array of 2n integers, your task is to group these integers into n pairs of integer, say (a1, b1), (a2, b2), ..., (an, bn) which makes sum of min(ai, bi) for all i from 1 to n as large as possible."

Example 1:

Input: [1,4,3,2]

Output: 4

Explanation: n is 2, and the maximum sum of pairs is 4 = min(1, 2) + min(3, 4).

Note:

n is a positive integer, which is in the range of [1, 10000].

All the integers in the array will be in the range of [-10000, 10000]."

563. Binary Tree Tilt <https://leetcode.com/problems/binary-tree-tilt> "Given a binary tree, return the tilt of the whole tree."

The tilt of a tree node is defined as the absolute difference between the sum of all left subtree node values and the sum of all right subtree node values. Null node has tilt 0.

The tilt of the whole tree is defined as the sum of all nodes' tilt.

Example:

Input:

```

      1
     / \
    2   3

```

Output: 1

Explanation:

Tilt of node 2 : 0

Tilt of node 3 : 0

Tilt of node 1 : |2-3| = 1

Tilt of binary tree : 0 + 0 + 1 = 1

Note:

The sum of node values in any subtree won't exceed the range of 32-bit integer. All the tilt values won't exceed the range of 32-bit integer."

564. Find the Closest Palindrome <https://leetcode.com/problems/find-the-closest-palindrome> "Given an integer n, find the closest integer (not including itself), which is a palindrome.

The 'closest' is defined as absolute difference minimized between two integers.

Example 1:

Input: "123"
Output: "121"

Note:

The input n is a positive integer represented by string, whose length will not exceed 18.

If there is a tie, return the smaller one as answer."

565. Array Nesting <https://leetcode.com/problems/array-nesting> "A zero-indexed array A of length N contains all integers from 0 to N-1. Find and return the longest length of set S, where $S[i] = \{A[i], A[A[i]], A[A[A[i]]], \dots\}$ subjected to the rule below.

Suppose the first element in S starts with the selection of element A[i] of index = i, the next element in S should be A[A[i]], and then A[A[A[i]]]. By that analogy, we stop adding right before a duplicate element occurs in S.

Example 1:

Input: A = [5,4,0,3,1,6,2]
Output: 4
Explanation:
 $A[0] = 5, A[1] = 4, A[2] = 0, A[3] = 3, A[4] = 1, A[5] = 6, A[6] = 2.$

One of the longest S[K]:
 $S[0] = \{A[0], A[5], A[6], A[2]\} = \{5, 6, 2, 0\}$

Note:

N is an integer within the range [1, 20,000].

The elements of A are all distinct.

Each element of A is an integer within the range [0, N-1]."

566. Reshape the Matrix <https://leetcode.com/problems/reshape-the-matrix> "In MATLAB, there is a very useful function called 'reshape', which can reshape a matrix into a new one with different size but keep its original data.

You're given a matrix represented by a two-dimensional array, and two positive integers r and c representing the row number and column number of the wanted reshaped matrix, respectively.

The reshaped matrix need to be filled with all the elements of the original matrix in the same row-traversing order as they were.

If the 'reshape' operation with given parameters is possible and legal, output the new reshaped matrix; Otherwise, output the original matrix.

Example 1:

Input:
nums =
[[1,2],
 [3,4]]
r = 1, c = 4
Output:

```
[[1,2,3,4]]
```

Explanation:

The row-traversing of nums is [1,2,3,4]. The new reshaped matrix is a 1 * 4 matrix, fill it row by row by using the previous list.

Example 2:

Input:

nums =

```
[[1,2],
```

```
[3,4]]
```

r = 2, c = 4

Output:

```
[[1,2],
```

```
[3,4]]
```

Explanation:

There is no way to reshape a 2 * 2 matrix to a 2 * 4 matrix. So output the original matrix.

Note:

The height and width of the given matrix is in range [1, 100].

The given r and c are all positive."

567. Permutation in String <https://leetcode.com/problems/permutation-in-string> "Given two strings s1 and s2, write a function to return true if s2 contains the permutation of s1. In other words, one of the first string's permutations is the substring of the second string.

Example 1:

Input:s1 = "ab" s2 = "eidbaooo"

Output:True

Explanation: s2 contains one permutation of s1 ("ba").

Example 2:

Input:s1= "ab" s2 = "eidboaoo"

Output: False

Note:

The input strings only contain lower case letters.

The length of both given strings is in range [1, 10,000]."

572. Subtree of Another Tree <https://leetcode.com/problems/subtree-of-another-tree> "Given two non-empty binary trees s and t, check whether tree t has exactly the same structure and node values with a subtree of s. A subtree of s is a tree consists of a node in s and all of this node's descendants. The tree s could also be considered as a subtree of itself.

Example 1:

Given tree s:

Given tree t:

1 2

Return true, because t has the same structure and node values with a subtree of s.

Example 2:

Given tree s:

Given tree t:

Return false."

575. Distribute Candies <https://leetcode.com/problems/distribute-candies> "Given a n integer array with even length, where different numbers in this array represent different kinds of candies. Each number means one candy of the corresponding kind. You need to distribute these candies equally in number to brother and sister. Return the maximum number of kinds of candies the sister could gain.

Example 1:

Input: candies = [1,1,2,2,3,3]

Output: 3

Explanation:

There are three different kinds of candies (1, 2 and 3), and two candies for each kind.

Optimal distribution: The sister has candies [1,2,3] and the brother has candies [1, 2,3], too.

The sister has three different kinds of candies.

Example 2:

Input: candies = [1,1,2,3]

Output: 2

Explanation: For example, the sister has candies [2,3] and the brother has candies [1,1].

The sister has two different kinds of candies, the brother has only one kind of candies.

Note:

The length of the given array is in range [2, 10,000], and will be even.

The number in given array is in range [-100,000, 100,000]."

576. Out of Boundary Paths <https://leetcode.com/problems/out-of-boundary-paths> "There is an m by n grid with a ball. Given the start coordinate (i,j) of the ball, you can move the ball to adjacent cell or cross the grid boundary in four directions (up, down, left, right). However, you can at most move N times. Find out the number of paths to move the ball out of grid boundary. The answer may be very large, return it after mod 109 + 7.

Example 1:

Input:m = 2, n = 2, N = 2, i = 0, j = 0

Output: 6

Explanation:

Example 2:

Input: m = 1, n = 3, N = 3, i = 0, j = 1
 Output: 12
 Explanation:

Note:

Once you move the ball out of boundary, you cannot move it back.
 The length and height of the grid is in range [1,50].
 N is in range [0,50]."

581. Shortest Unsorted Continuous Subarray <https://leetcode.com/problems/shortest-unsorted-continuous-subarray> "Given an integer array, you need to find one continuous subarray that if you only sort this subarray in ascending order, then the whole array will be sorted in ascending order, too.

You need to find the shortest such subarray and output its length.

Example 1:

Input: [2, 6, 4, 8, 10, 9, 15]
 Output: 5
 Explanation: You need to sort [6, 4, 8, 10, 9] in ascending order to make the whole array sorted in ascending order.

Note:

Then length of the input array is in range [1, 10,000].
 The input array may contain duplicates, so ascending order here means \leq ."
 583. Delete Operation for Two Strings <https://leetcode.com/problems/delete-operation-for-two-strings> "Given two words word1 and word2, find the minimum number of steps required to make word1 and word2 the same, where in each step you can delete one character in either string.

Example 1:

Input: "sea", "eat"
 Output: 2
 Explanation: You need one step to make "sea" to "ea" and another step to make "eat" to "ea".

Note:

The length of given words won't exceed 500.
 Characters in given words can only be lower-case letters."
 587. Erect the Fence <https://leetcode.com/problems/erect-the-fence> "There are some trees, where each tree is represented by (x,y) coordinate in a two-dimensional garden. Your job is to fence the entire garden using the minimum length of rope as it is expensive. The garden is well fenced only if all the trees are enclosed. Your task is to help find the coordinates of trees which are exactly located on the fence perimeter.

Example 1:

Input: [[1,1],[2,2],[2,0],[2,4],[3,3],[4,2]]
 Output: [[1,1],[2,0],[4,2],[3,3],[2,4]]
 Explanation:

Example 2:

Input: [[1,2],[2,2],[4,2]]
 Output: [[1,2],[2,2],[4,2]]
 Explanation:

Even you only have trees in a line, you need to use rope to enclose them.

Note:

All trees should be enclosed together. You cannot cut the rope to enclose trees that will separate them in more than one group.
 All input integers will range from 0 to 100.
 The garden has at least one tree.
 All coordinates are distinct.

Input points have NO order. No order required for output."

591. Tag Validator <https://leetcode.com/problems/tag-validator> "Given a string representing a code snippet, you need to implement a tag validator to parse the code and return whether it is valid. A code snippet is valid if all the following rules hold :

The code must be wrapped in a valid closed tag. Otherwise, the code is invalid.
 A closed tag (not necessarily valid) has exactly the following format : <TAG_NAME>TAG_CONTENT</TAG_NAME>. Among them, <TAG_NAME> is the start tag, and </TAG_NAME> is the end tag. The TAG_NAME in start and end tags should be the same. A closed tag is valid if and only if the TAG_NAME and TAG_CONTENT are valid.
 A valid TAG_NAME only contain upper-case letters, and has length in range [1,9]. Otherwise, the TAG_NAME is invalid.
 A valid TAG_CONTENT may contain other valid closed tags, cdata and any characters (see note1) EXCEPT unmatched <, unmatched start and end tag, and unmatched or closed tags with invalid TAG_NAME. Otherwise, the TAG_CONTENT is invalid.
 A start tag is unmatched if no end tag exists with the same TAG_NAME, and vice versa. However, you also need to consider the issue of unbalanced when tags are nested.
 A < is unmatched if you cannot find a subsequent >. And when you find a < or </, all the subsequent characters until the next > should be parsed as TAG_NAME (not necessarily valid).
 The cdata has the following format : <![CDATA[CDATA_CONTENT]]>. The range of CDATA_CONTENT is defined as the characters between <![CDATA[and the first subsequent]]>. CDATA_CONTENT may contain any characters. The function of cdata is to forbid the validator to parse CDATA_CONTENT, so even it has some characters that can be parsed as tag (no matter valid or invalid), you should treat it as regular characters.

Valid Code Examples:

Input: "<DIV>This is the first line <![CDATA[<div>]]></DIV>"

Output: True

Explanation:

The code is wrapped in a closed tag : <DIV> and </DIV>.

The TAG_NAME is valid, the TAG_CONTENT consists of some characters and cdata.

Although CDATA_CONTENT has unmatched start tag with invalid TAG_NAME, it should be considered as plain text, not parsed as tag.

So TAG_CONTENT is valid, and then the code is valid. Thus return true.

Input: "<DIV>>> ![CDATA[<div>]]>]]></DIV>"

Output: True

Explanation:

We first separate the code into : start_tag|tag_content|end_tag.

start_tag -> "<DIV>"

end_tag -> "</DIV>"

tag_content could also be separated into : text1|cdata|text2.

text1 -> ">> ![CDATA[]]"

cdata -> "<![CDATA[<div>]]>", where the CDATA_CONTENT is "<div>]"

text2 -> "]]>]"

The reason why start_tag is NOT "<DIV>>" is because of the rule 6.

The reason why cdata is NOT "<![CDATA[<div>]]>" is because of the rule 7.

Invalid Code Examples:

Input: "<A> "

Output: False

Explanation: Unbalanced. If "<A>" is closed, then "" must be unmatched, and vice versa.

Input: "<DIV> div tag is not closed <DIV>"

Output: False

Input: "<DIV> unmatched < </DIV>"

Output: False

Input: "<DIV> closed tags with invalid tag name 123 </DIV>"

Output: False

Input: "<DIV> unmatched tags with invalid tag name </1234567890> and <CDATA[[]]> </DIV>"

Output: False

Input: "<DIV> unmatched start tag and unmatched end tag </C> </DIV>"

Output: False

Note:

For simplicity, you could assume the input code (including the any characters mentioned above) only contain letters, digits, '<', '>', '/', '!', '[', ']' and ' '.
592. Fraction Addition and Subtraction <https://leetcode.com/problems/fraction-addition-and-subtraction> "Given a string representing an expression of fraction addition and subtraction, you need to return the calculation result in string format. The final result should be irreducible fraction. If your final result is an integer, say 2, you need to change it to the format of fraction that has denominator 1. So in this case, 2 should be converted to 2/1."

Example 1:

Input: "-1/2+1/2"

Output: "0/1"

Example 2:

Input: "-1/2+1/2+1/3"

Output: "1/3"

Example 3:

Input: "1/3-1/2"

Output: "-1/6"

Example 4:

Input: "5/3+1/3"

Output: "2/1"

Note:

The input string only contains '0' to '9', '/', '+' and '-'. So does the output. Each fraction (input and output) has format \pm numerator/denominator. If the first input fraction or the output is positive, then '+' will be omitted. The input only contains valid irreducible fractions, where the numerator and denominator of each fraction will always be in the range [1,10]. If the denominator is 1, it means this fraction is actually an integer in a fraction format defined above. The number of given fractions will be in the range [1,10]. The numerator and denominator of the final result are guaranteed to be valid and in the range of 32-bit int."

593. Valid Square <https://leetcode.com/problems/valid-square> "Given the coordinates of four points in 2D space, return whether the four points could construct a square."

The coordinate (x,y) of a point is represented by an integer array with two integers.

Example:

Input: p1 = [0,0], p2 = [1,1], p3 = [1,0], p4 = [0,1]

Output: True

Note:

All the input integers are in the range [-10000, 10000]. A valid square has four equal sides with positive length and four equal angles (90-degree angles). Input points have no order."

594. Longest Harmonious Subsequence <https://leetcode.com/problems/longest-harmonious-subsequence> "We define a harmonious array is an array where the difference between its maximum value and its minimum value is exactly 1."

Now, given an integer array, you need to find the length of its longest harmonious subsequence among all its possible subsequences.

Example 1:

Input: [1,3,2,2,5,2,3,7]

Output: 5

Explanation: The longest harmonious subsequence is [3,2,2,2,3].

Note:

The length of the input array will not exceed 20,000."

595. Big Countries <https://leetcode.com/problems/big-countries> "There is a table World"

name	continent	area	population	gdp
Afghanistan	Asia	652230	25500100	20343000
Albania	Europe	28748	2831741	12960000
Algeria	Africa	2381741	37100000	188681000
Andorra	Europe	468	78115	3712000
Angola	Africa	1246700	20609294	100990000

A country is big if it has an area of bigger than 3 million square km or a population of more than 25 million.

Write a SQL solution to output big countries' name, population and area.

For example, according to the above table, we should output:

name	population	area
Afghanistan	25500100	652230
Algeria	37100000	2381741

596. Classes More Than 5 Students <https://leetcode.com/problems/classes-more-than-5-students> "There is a table courses with columns: student and class

Please list out all classes which have more than or equal to 5 students.

For example, the table:

student	class
A	Math
B	English
C	Math
D	Biology
E	Math
F	Computer
G	Math
H	Math
I	Math

Should output:

class
Math

Note:

The students should not be counted duplicate in each course."

598. Range Addition II <https://leetcode.com/problems/range-addition-ii> "Given an m * n matrix M initialized with all 0's and several update operations. Operations are represented by a 2D array, and each operation is represented by an array with two positive integers a and b, which means M[i][j] should be added by one for all 0 ≤ i < a and 0 ≤ j < b. You need to count and return the number of maximum integers in the matrix after performing all the operations.

Example 1:

Input:

m = 3, n = 3

operations = [[2,2],[3,3]]

Output: 4

Explanation:

Initially, M =

```
[[0, 0, 0],
 [0, 0, 0],
 [0, 0, 0]]
```

After performing [2,2], M =

```
[[1, 1, 0],
 [1, 1, 0],
 [0, 0, 0]]
```

After performing [3,3], M =

```
[[2, 2, 1],
 [2, 2, 1],
 [1, 1, 1]]
```

So the maximum integer in M is 2, and there are four of it in M. So return 4.

Note:

The range of m and n is [1,40000].

The range of a is [1,m], and the range of b is [1,n].

The range of operations size won't exceed 10,000."

599. Minimum Index Sum of Two Lists <https://leetcode.com/problems/minimum-index-sum-of-two-lists> "Suppose Andy and Doris want to choose a restaurant for dinner, and they both have a list of favorite restaurants represented by strings.

You need to help them find out their common interest with the least list index sum. If there is a choice tie between answers, output all of them with no order requirement. You could assume there always exists an answer.

Example 1:

Input:

```
[["Shogun", "Tapioca Express", "Burger King", "KFC"],
 ["Piatti", "The Grill at Torrey Pines", "Hungry Hunter Steakhouse", "Shogun"]]
```

Output: ["Shogun"]

Explanation: The only restaurant they both like is "Shogun".

Example 2:

Input:

```
[["Shogun", "Tapioca Express", "Burger King", "KFC"],
 ["KFC", "Shogun", "Burger King"]]
```

Output: ["Shogun"]

Explanation: The restaurant they both like and have the least index sum is "Shogun" with index sum 1 (0+1).

Note:

The length of both lists will be in the range of [1, 1000].

The length of strings in both lists will be in the range of [1, 30].

The index is starting from 0 to the list length minus 1.

No duplicates in both lists."

600. Non-negative Integers without Consecutive Ones <https://leetcode.com/problems/non-negative-integers-without-consecutive-ones> "Given a positive integer n, find the number of non-negative integers less than or equal to n, whose binary representations do NOT contain consecutive ones.

Example 1:

Input: 5

Output: 5

Explanation:

Here are the non-negative integers ≤ 5 with their corresponding binary representations:

0 : 0

1 : 1

2 : 10

3 : 11

4 : 100

5 : 101

Among them, only integer 3 disobeys the rule (two consecutive ones) and the other 5 satisfy the rule.

Note:

1 <= n <= 109"

601. Human Traffic of Stadium <https://leetcode.com/problems/human-traffic-of-stadium> "X city built a new stadium, each day many people visit it and the stats are saved as these columns: id, date, people

Please write a query to display the records which have 3 or more consecutive rows and the amount of people more than 100(inclusive).

For example, the table stadium:

id	date	people
1	2017-01-01	10
2	2017-01-02	109
3	2017-01-03	150
4	2017-01-04	99
5	2017-01-05	145
6	2017-01-06	1455
7	2017-01-07	199
8	2017-01-08	188

For the sample data above, the output is:

id	date	people
5	2017-01-05	145
6	2017-01-06	1455
7	2017-01-07	199
8	2017-01-08	188

Note:

Each day only have one row record, and the dates are increasing with id increasing."

605. Can Place Flowers <https://leetcode.com/problems/can-place-flowers> "Suppose you have a long flowerbed in which some of the plots are planted and some are not. However, flowers cannot be planted in adjacent plots - they would compete for water and both would die.

Given a flowerbed (represented as an array containing 0 and 1, where 0 means empty and 1 means not empty), and a number n, return if n new flowers can be planted in it without violating the no-adjacent-flowers rule.

Example 1:

Input: flowerbed = [1,0,0,0,1], n = 1

Output: True

Example 2:

Input: flowerbed = [1,0,0,0,1], n = 2

Output: False

Note:

The input array won't violate no-adjacent-flowers rule.

The input array size is in the range of [1, 20000].

n is a non-negative integer which won't exceed the input array size."

606. Construct String from Binary Tree <https://leetcode.com/problems/construct-string-from-binary-tree>

ng-from-binary-tree "You need to construct a string consists of parenthesis and integers from a binary tree with the preorder traversing way.

The null node needs to be represented by empty parenthesis pair "()". And you need to omit all the empty parenthesis pairs that don't affect the one-to-one mapping relationship between the string and the original binary tree.

Example 1:

Input: Binary tree: [1,2,3,4]

Output: "1(2(4))(3)"

Explanation: Originallay it needs to be "1(2(4))()(3())()", but you need to omit all the unnecessary empty parenthesis pairs. And it will be "1(2(4))(3)".

Example 2:

Input: Binary tree: [1,2,3,null,4]

Output: "1(2()(4))(3)"

Explanation: Almost the same as the first example, except we can't omit the first parenthesis pair to break the one-to-one mapping relationship between the input and the output."

609. Find Duplicate File in System <https://leetcode.com/problems/find-duplicate-file-in-system> "Given a list of directory info including directory path, and all the files with contents in this directory, you need to find out all the groups of duplicate files in the file system in terms of their paths.

A group of duplicate files consists of at least two files that have exactly the same content.

A single directory info string in the input list has the following format:

"root/d1/d2/.../dm f1.txt(f1_content) f2.txt(f2_content) ... fn.txt(fn_content)"

It means there are n files (f1.txt, f2.txt ... fn.txt with content f1_content, f2_content ... fn_content, respectively) in directory root/d1/d2/.../dm. Note that n >= 1 and m >= 0. If m = 0, it means the directory is just the root directory.

The output is a list of group of duplicate file paths. For each group, it contains all the file paths of the files that have the same content. A file path is a string that has the following format:

"directory_path/file_name.txt"

Example 1:

Input:

["root/a 1.txt(abcd) 2.txt(efgh)", "root/c 3.txt(abcd)", "root/c/d 4.txt(efgh)", "root 4.txt(efgh)"]

Output:

[["root/a/2.txt","root/c/d/4.txt","root/4.txt"],["root/a/1.txt","root/c/3.txt"]]

Note:

No order is required for the final output.

You may assume the directory name, file name and file content only has letters and digits, and the length of file content is in the range of [1,50].

The number of files given is in the range of [1,20000].

You may assume no files or directories share the same name in the same directory.

You may assume each given directory info represents a unique directory. Directory path and file info are separated by a single blank space.

Follow-up beyond contest:

Imagine you are given a real file system, how will you search files? DFS or BFS?

If the file content is very large (GB level), how will you modify your solution?

If you can only read the file by 1kb each time, how will you modify your solution?

What is the time complexity of your modified solution? What is the most time-consuming part and memory consuming part of it? How to optimize?

How to make sure the duplicated files you find are not false positive?"

611. Valid Triangle Number <https://leetcode.com/problems/valid-triangle-number> "Given an array consists of non-negative integers, your task is to count the number of triplets chosen from the array that can make triangles if we take them as side lengths of a triangle.

Example 1:

Input: [2,2,3,4]

Output: 3

Explanation:

Valid combinations are:

2,3,4 (using the first 2)

2,3,4 (using the second 2)

2,2,3

Note:

The length of the given array won't exceed 1000.

The integers in the given array are in the range of [0, 1000]."

617. Merge Two Binary Trees <https://leetcode.com/problems/merge-two-binary-trees>

"Given two binary trees and imagine that when you put one of them to cover the other, some nodes of the two trees are overlapped while the others are not.

You need to merge them into a new binary tree. The merge rule is that if two nodes overlap, then sum node values up as the new value of the merged node. Otherwise, the NOT null node will be used as the node of new tree.

Example 1:

Input:

Output:

Merged tree:

Note:

The merging process must start from the root nodes of both trees."

620. Not Boring Movies <https://leetcode.com/problems/not-boring-movies> "X city opened a new cinema, many people would like to go to this cinema. The cinema also gives out a poster indicating the movies' ratings and descriptions.

Please write a SQL query to output movies with an odd numbered ID and a description that is not 'boring'. Order the result by rating.

For example, table cinema:

id	movie	description	rating
1	War	great 3D	8.9
2	Science	fiction	8.5
3	Irish	boring	6.2
4	Ice song	Fantasy	8.6
5	House card	Interesting	9.1

For the example above, the output should be:

id	movie	description	rating
5	House card	Interesting	9.1
1	War	great 3D	8.9

621. Task Scheduler <https://leetcode.com/problems/task-scheduler> "Given a character array representing tasks CPU need to do. It contains capital letters A to Z where different letters represent different tasks. Tasks could be done without original order. Each task could be done in one interval. For each interval, CPU could finish one task or just be idle.

However, there is a non-negative cooling interval n that means between two same tasks, there must be at least n intervals that CPU are doing different tasks or just be idle.

You need to return the least number of intervals the CPU will take to finish all the given tasks.

Example 1:

Input: tasks = ["A","A","A","B","B","B"], $n = 2$

Output: 8

Explanation: A -> B -> idle -> A -> B -> idle -> A -> B.

Note:

The number of tasks is in the range $[1, 10000]$.

The integer n is in the range $[0, 100]$."

623. Add One Row to Tree <https://leetcode.com/problems/add-one-row-to-tree> "Given the root of a binary tree, then value v and depth d , you need to add a row of nodes with value v at the given depth d . The root node is at depth 1.

The adding rule is: given a positive integer depth d , for each NOT null tree nodes N in depth $d-1$, create two tree nodes with value v as N 's left subtree root and right subtree root. And N 's original left subtree should be the left subtree of the new left subtree root, its original right subtree should be the right subtree of the new right subtree root. If depth d is 1 that means there is no depth $d-1$ at all, then create a tree node with value v as the new root of the whole original tree, and the original tree is the new root's left subtree.

Example 1:

Input:

A binary tree as following:

```

  / \ /
 3   1 5

```

v = 1

d = 2

Output:

```

      4
     / \
    1   1
   / \ / \
  2   1 6
 / \ / \
3  1 5

```

Example 2:

Input:

A binary tree as following:

```

      4
     /
    2
   / \
  3   1

```

v = 1

d = 3

Output:

```

      4
     /
    2
   / \
  1   1
 / \ / \
3  1 1

```

Note:

The given d is in range [1, maximum depth of the given tree + 1].

The given binary tree has at least one tree node."

626. Exchange Seats <https://leetcode.com/problems/exchange-seats> "Mary is a teacher in a middle school and she has a table seat storing students' names and their corresponding seat ids.

The column id is continuous increment.

Mary wants to change seats for the adjacent students.

Can you write a SQL query to output the result for Mary?

id	student
1	Abbot
2	Doris
3	Emerson
4	Green
5	Jeames

For the sample input, the output is:

id	student
1	Doris
2	Abbot
3	Green

4	Emerson
5	Jeames

Note:

If the number of students is odd, there is no need to change the last one's seat."
627. Swap Salary <https://leetcode.com/problems/swap-salary> "Given a table salary, such as the one below, that has m=male and f=female values. Swap all f and m values (i.e., change all f values to m and vice versa) with a single update query and no intermediate temp table.

For example:

id	name	sex	salary
1	A	m	2500
2	B	f	1500
3	C	m	5500
4	D	f	500

After running your query, the above salary table should have the following rows:

id	name	sex	salary
1	A	f	2500
2	B	m	1500
3	C	f	5500
4	D	m	500

628. Maximum Product of Three Numbers <https://leetcode.com/problems/maximum-product-of-three-numbers> "Given an integer array, find three numbers whose product is maximum and output the maximum product.

Example 1:

Input: [1,2,3]
Output: 6

Example 2:

Input: [1,2,3,4]
Output: 24

Note:

The length of the given array will be in range [3,104] and all elements are in the range [-1000, 1000]. Multiplication of any three numbers in the input won't exceed the range of 32-bit signed integer."
629. K Inverse Pairs Array <https://leetcode.com/problems/k-inverse-pairs-array> "Given two integers n and k, find how many different arrays consist of numbers from 1 to n such that there are exactly k inverse pairs.

We define an inverse pair as following:
For ith and jth element in the array, if $i < j$ and $a[i] > a[j]$ then it's an inverse pair; Otherwise, it's not.

Since the answer may be very large, the answer should be modulo $10^9 + 7$.

Example 1:

Input: n = 3, k = 0
Output: 1
Explanation:

Only the array [1,2,3] which consists of numbers from 1 to 3 has exactly 0 inverse pair.

Example 2:

Input: n = 3, k = 1

Output: 2

Explanation:

The array [1,3,2] and [2,1,3] have exactly 1 inverse pair.

Note:

The integer n is in the range [1, 1000] and k is in the range [0, 1000]."
630. Course Schedule III <https://leetcode.com/problems/course-schedule-iii> "There are n different online courses numbered from 1 to n. Each course has some duration t (course length) and closed on dth day. A course should be taken continuously for t days and must be finished before or on the dth day. You will start at the 1st day."

Given n online courses represented by pairs (t,d), your task is to find the maximal number of courses that can be taken.

Example:

Input: [[100, 200], [200, 1300], [1000, 1250], [2000, 3200]]

Output: 3

Explanation:

There're totally 4 courses, but you can take 3 courses at most:

First, take the 1st course, it costs 100 days so you will finish it on the 100th day, and ready to take the next course on the 101st day.

Second, take the 3rd course, it costs 1000 days so you will finish it on the 1100th day, and ready to take the next course on the 1101st day.

Third, take the 2nd course, it costs 200 days so you will finish it on the 1300th day.

The 4th course cannot be taken now, since you will finish it on the 3300th day, which exceeds the closed date.

Note:

The integer $1 \leq d, t, n \leq 10,000$.

You can't take two courses simultaneously."

632. Smallest Range <https://leetcode.com/problems/smallest-range> "You have k lists of sorted integers in ascending order. Find the smallest range that includes at least one number from each of the k lists."

We define the range [a,b] is smaller than range [c,d] if $b-a < d-c$ or $a < c$ if $b-a = d-c$.

Example 1:

Input: [[4,10,15,24,26], [0,9,12,20], [5,18,22,30]]

Output: [20,24]

Explanation:

List 1: [4, 10, 15, 24,26], 24 is in range [20,24].

List 2: [0, 9, 12, 20], 20 is in range [20,24].

List 3: [5, 18, 22, 30], 22 is in range [20,24].

Note:

The given list may contain duplicates, so ascending order means \geq here.

$1 \leq k \leq 3500$

$-105 \leq \text{value of elements} \leq 105$.

For Java users, please note that the input type has been changed to `List<List<Integer>>`. And after you reset the code template, you'll see this point."

633. Sum of Square Numbers <https://leetcode.com/problems/sum-of-square-numbers> "Given a non-negative integer c , your task is to decide whether there're two integers a and b such that $a^2 + b^2 = c$.

Example 1:

Input: 5

Output: True

Explanation: $1^2 + 2^2 = 5$

Example 2:

Input: 3

Output: False"

636. Exclusive Time of Functions <https://leetcode.com/problems/exclusive-time-of-functions> "Given the running logs of n functions that are executed in a nonpreemptive single threaded CPU, find the exclusive time of these functions.

Each function has a unique id, start from 0 to $n-1$. A function may be called recursively or by another function.

A log is a string has this format : `function_id:start_or_end:timestamp`. For example, `"0:start:0"` means function 0 starts from the very beginning of time 0. `"0:end:0"` means function 0 ends to the very end of time 0.

Exclusive time of a function is defined as the time spent within this function, the time spent by calling other functions should not be considered as this function's exclusive time. You should return the exclusive time of each function sorted by their function id.

Example 1:

Input:

$n = 2$

logs =

```
[ "0:start:0",
  "1:start:2",
  "1:end:5",
  "0:end:6"]
```

Output:[3, 4]

Explanation:

Function 0 starts at time 0, then it executes 2 units of time and reaches the end of time 1.

Now function 0 calls function 1, function 1 starts at time 2, executes 4 units of time and end at time 5.

Function 0 is running again at time 6, and also end at the time 6, thus executes 1 unit of time.

So function 0 totally execute $2 + 1 = 3$ units of time, and function 1 totally execute 4 units of time.

Note:

Input logs will be sorted by timestamp, NOT log id.

Your output should be sorted by function id, which means the 0th element of your output corresponds to the exclusive time of function 0.

Two functions won't start or end at the same time.

Functions could be called recursively, and will always end.

$1 \leq n \leq 100$ "

637. Average of Levels in Binary Tree <https://leetcode.com/problems/average-of-levels-in-binary-tree> "Given a non-empty binary tree, return the average value of the nodes on each level in the form of an array.

Example 1:

Input:

Output: [3, 14.5, 11]

Explanation:

The average value of nodes on level 0 is 3, on level 1 is 14.5, and on level 2 is 11. Hence return [3, 14.5, 11].

Note:

The range of node's value is in the range of 32-bit signed integer."

638. Shopping Offers <https://leetcode.com/problems/shopping-offers> "In LeetCode Store, there are some kinds of items to sell. Each item has a price.

However, there are some special offers, and a special offer consists of one or more different kinds of items with a sale price.

You are given the each item's price, a set of special offers, and the number we need to buy for each item.

The job is to output the lowest price you have to pay for exactly certain items as given, where you could make optimal use of the special offers.

Each special offer is represented in the form of an array, the last number represents the price you need to pay for this special offer, other numbers represent how many specific items you could get if you buy this offer.

You could use any of special offers as many times as you want.

Example 1:

Input: [2,5], [[3,0,5],[1,2,10]], [3,2]

Output: 14

Explanation:

There are two kinds of items, A and B. Their prices are \$2 and \$5 respectively.

In special offer 1, you can pay \$5 for 3A and 0B

In special offer 2, you can pay \$10 for 1A and 2B.

You need to buy 3A and 2B, so you may pay \$10 for 1A and 2B (special offer #2), and \$4 for 2A.

Example 2:

Input: [2,3,4], [[1,1,0,4],[2,2,1,9]], [1,2,1]

Output: 11

Explanation:

The price of A is \$2, and \$3 for B, \$4 for C.

You may pay \$4 for 1A and 1B, and \$9 for 2A, 2B and 1C.

You need to buy 1A, 2B and 1C, so you may pay \$4 for 1A and 1B (special offer #1), and \$3 for 1B, \$4 for 1C.

You cannot add more items, though only \$9 for 2A, 2B and 1C.

Note:

There are at most 6 kinds of items, 100 special offers.

For each item, you need to buy at most 6 of them.

You are not allowed to buy more items than you want, even if that would lower the overall price."

639. Decode Ways II <https://leetcode.com/problems/decode-ways-ii> "A message containing letters from A-Z is being encoded to numbers using the following mapping way:

```
'A' -> 1
'B' -> 2
...
'Z' -> 26
```

Beyond that, now the encoded string can also contain the character '*', which can be treated as one of the numbers from 1 to 9.

Given the encoded message containing digits and the character '*', return the total number of ways to decode it.

Also, since the answer may be very large, you should return the output mod $10^9 + 7$.

Example 1:

Input: "*"

Output: 9

Explanation: The encoded message can be decoded to the string: "A", "B", "C", "D", "E", "F", "G", "H", "I".

Example 2:

Input: "1*"

Output: $9 + 9 = 18$

Note:

The length of the input string will fit in range $[1, 105]$.

The input string will only contain the character '*' and digits '0' - '9'."

640. Solve the Equation <https://leetcode.com/problems/solve-the-equation> "Solve a given equation and return the value of x in the form of string "x=#value". The equation contains only '+', '-' operation, the variable x and its coefficient.

If there is no solution for the equation, return "No solution".

If there are infinite solutions for the equation, return "Infinite solutions".

If there is exactly one solution for the equation, we ensure that the value of x is an integer.

Example 1:

Input: "x+5-3+x=6+x-2"

Output: "x=2"

Example 2:

Input: "x=x"

Output: "Infinite solutions"

Example 3:

Input: "2x=x"

Output: "x=0"

Example 4:

Input: "2x+3x-6x=x+2"

Output: "x=-1"

Example 5:

Input: "x=x+2"

Output: "No solution"

643. Maximum Average Subarray I <https://leetcode.com/problems/maximum-average-subarray-i> "Given an array consisting of n integers, find the contiguous subarray of given length k that has the maximum average value. And you need to output the maximum average value."

Example 1:

Input: [1,12,-5,-6,50,3], k = 4

Output: 12.75

Explanation: Maximum average is $(12-5-6+50)/4 = 51/4 = 12.75$

Note:

1 <= k <= n <= 30,000.

Elements of the given array will be in the range [-10,000, 10,000]."

645. Set Mismatch <https://leetcode.com/problems/set-mismatch> "The set S originally contains numbers from 1 to n. But unfortunately, due to the data error, one of the numbers in the set got duplicated to another number in the set, which results in repetition of one number and loss of another number."

Given an array nums representing the data status of this set after the error. Your task is to firstly find the number occurs twice and then find the number that is missing. Return them in the form of an array.

Example 1:

Input: nums = [1,2,2,4]

Output: [2,3]

Note:

The given array size will be in the range [2, 10000].

The given array's numbers won't have any order."

646. Maximum Length of Pair Chain <https://leetcode.com/problems/maximum-length-of-pair-chain>

pair-chain "You are given n pairs of numbers. In every pair, the first number is always smaller than the second number.

Now, we define a pair (c, d) can follow another pair (a, b) if and only if $b < c$. Chain of pairs can be formed in this fashion.

Given a set of pairs, find the length longest chain which can be formed. You needn't use up all the given pairs. You can select pairs in any order.

Example 1:

Input: [[1,2], [2,3], [3,4]]

Output: 2

Explanation: The longest chain is [1,2] -> [3,4]

Note:

The number of given pairs will be in the range [1, 1000]."

647. Palindromic Substrings <https://leetcode.com/problems/palindromic-substrings>

"Given a string, your task is to count how many palindromic substrings in this string.

The substrings with different start indexes or end indexes are counted as different substrings even they consist of same characters.

Example 1:

Input: "abc"

Output: 3

Explanation: Three palindromic strings: "a", "b", "c".

Example 2:

Input: "aaa"

Output: 6

Explanation: Six palindromic strings: "a", "a", "a", "aa", "aa", "aaa".

Note:

The input string length won't exceed 1000."

648. Replace Words <https://leetcode.com/problems/replace-words> "In English, we have a concept called root, which can be followed by some other words to form another longer word - let's call this word successor. For example, the root an, followed by other, which can form another word another.

Now, given a dictionary consisting of many roots and a sentence. You need to replace all the successor in the sentence with the root forming it. If a successor has many roots can form it, replace it with the root with the shortest length.

You need to output the sentence after the replacement.

Example 1:

```
Input: dict = ["cat", "bat", "rat"]
sentence = "the cattle was rattled by the battery"
Output: "the cat was rat by the bat"
```

Note:

The input will only have lower-case letters.

1 <= dict words number <= 1000

1 <= sentence words number <= 1000

1 <= root length <= 100

1 <= sentence words length <= 1000"

649. Dota2 Senate <https://leetcode.com/problems/dota2-senate> "In the world of Dota2, there are two parties: the Radiant and the Dire.

The Dota2 senate consists of senators coming from two parties. Now the senate wants to make a decision about a change in the Dota2 game. The voting for this change is a round-based procedure. In each round, each senator can exercise one of the two rights:

Ban one senator's right:

A senator can make another senator lose all his rights in this and all the following rounds.

Announce the victory:

If this senator found the senators who still have rights to vote are all from the same party, he can announce the victory and make the decision about the change in the game.

Given a string representing each senator's party belonging. The character 'R' and 'D' represent the Radiant party and the Dire party respectively. Then if there are n senators, the size of the given string will be n.

The round-based procedure starts from the first senator to the last senator in the given order. This procedure will last until the end of voting. All the senators who have lost their rights will be skipped during the procedure.

Suppose every senator is smart enough and will play the best strategy for his own party, you need to predict which party will finally announce the victory and make the change in the Dota2 game. The output should be Radiant or Dire.

Example 1:

Input: "RD"

Output: "Radiant"

Explanation: The first senator comes from Radiant and he can just ban the next senator's right in the round 1.

And the second senator can't exercise any rights any more since his right has been banned.

And in the round 2, the first senator can just announce the victory since he is the only guy in the senate who can vote.

Example 2:

Input: "RDD"
Output: "Dire"

Explanation:

The first senator comes from Radiant and he can just ban the next senator's right in the round 1.

And the second senator can't exercise any rights anymore since his right has been banned.

And the third senator comes from Dire and he can ban the first senator's right in the round 1.

And in the round 2, the third senator can just announce the victory since he is the only guy in the senate who can vote.

Note:

The length of the given string will in the range [1, 10,000]."

650. 2 Keys Keyboard <https://leetcode.com/problems/2-keys-keyboard> "Initially on a notepad only one character 'A' is present. You can perform two operations on this notepad for each step:

Copy All: You can copy all the characters present on the notepad (partial copy is not allowed).

Paste: You can paste the characters which are copied last time.

Given a number n. You have to get exactly n 'A' on the notepad by performing the minimum number of steps permitted. Output the minimum number of steps to get n 'A'.

Example 1:

Input: 3
Output: 3
Explanation:
Initially, we have one character 'A'.
In step 1, we use Copy All operation.
In step 2, we use Paste operation to get 'AA'.
In step 3, we use Paste operation to get 'AAA'.

Note:

The n will be in the range [1, 1000]."

652. Find Duplicate Subtrees <https://leetcode.com/problems/find-duplicate-subtrees> "Given a binary tree, return all duplicate subtrees. For each kind of duplicate subtrees, you only need to return the root node of any one of them.

Two trees are duplicate if they have the same structure with same node values.

Example 1:

The following are two duplicate subtrees:

and
4

Therefore, you need to return above trees' root in the form of a list."
653. Two Sum IV - Input is a BST <https://leetcode.com/problems/two-sum-iv-input-is-a-bst> "Given a Binary Search Tree and a target number, return true if there exist two elements in the BST such that their sum is equal to the given target.

Example 1:

Input:

Target = 9

Output: True

Example 2:

Input:

Target = 28

Output: False"

654. Maximum Binary Tree <https://leetcode.com/problems/maximum-binary-tree> "Given an integer array with no duplicates. A maximum tree building on this array is defined as follow:

The root is the maximum number in the array.

The left subtree is the maximum tree constructed from left part subarray divided by the maximum number.

The right subtree is the maximum tree constructed from right part subarray divided by the maximum number.

Construct the maximum tree by the given array and output the root node of this tree.

Example 1:

Input: [3,2,1,6,0,5]

Output: return the tree root node representing the following tree:

Note:

The size of the given array will be in the range [1,1000]."

655. Print Binary Tree <https://leetcode.com/problems/print-binary-tree> "Print a binary tree in an m*n 2D string array following these rules:

The row number m should be equal to the height of the given binary tree. The column number n should always be an odd number. The root node's value (in string format) should be put in the exactly middle of the first row it can be put. The column and the row where the root node belongs will separate the rest space into two parts (left-bottom part and right-bottom part). You should print the left subtree in the left-bottom part and print the right subtree in the right-bottom part. The left-bottom part and the right-bottom part should have the same size. Even if one subtree is none while the other is not, you don't need to print anything for the none subtree but still need to leave the space as large as that for the other subtree. However, if two subtrees are none, then you don't need to leave space for both of them. Each unused space should contain an empty string `""`. Print the subtrees following the same rules.

Example 1:

Input:

```

  1
 /
2

```

Output:

```

[["", "1", ""],
 ["2", "", ""]]

```

Example 2:

Input:

```

  1
 / \
2   3
 \
  4

```

Output:

```

[["", "", "", "1", "", "", ""],
 [ "", "2", "", "", "3", "", ],
 [ "", "", "4", "", "", "", ]]

```

Example 3:

Input:

```

  1
 / \
2   5
 / \
3   4
/
4

```

Output:

```

[["", "", "", "", "1", "", "", "", "", ""],
 [ "", "2", "", "", "", "5", "", "", "", ],
 [ "", "", "3", "", "", "", "4", "", "", ],
 [ "", "4", "", "", "", "", "", "", "", ],
 [ "", "", "4", "", "", "", "", "", "", ]]

```

Note:

The height of binary tree is in the range of $[1, 10]$.
 657. Judge Route Circle <https://leetcode.com/problems/judge-route-circle> "Initially, there is a Robot at position (0, 0). Given a sequence of its moves, judge if this robot makes a circle, which means it moves back to the original place."

The move sequence is represented by a string. And each move is represent by a character. The valid robot moves are R (Right), L (Left), U (Up) and D (down). The output should be true or false representing whether the robot makes a circle.

Example 1:

Input: "UD"
Output: true

Example 2:

Input: "LL"
Output: false

658. Find K Closest Elements <https://leetcode.com/problems/find-k-closest-elements>
"Given a sorted array, two integers k and x, find the k closest elements to x in the array. The result should also be sorted in ascending order. If there is a tie, the smaller elements are always preferred."

Example 1:

Input: [1,2,3,4,5], k=4, x=3
Output: [1,2,3,4]

Example 2:

Input: [1,2,3,4,5], k=4, x=-1
Output: [1,2,3,4]

Note:

The value k is positive and will always be smaller than the length of the sorted array.

Length of the given array is positive and will not exceed 104

Absolute value of elements in the array and x will not exceed 104

UPDATE (2017/9/19):

The arr parameter had been changed to an array of integers (instead of a list of integers). Please reload the code definition to get the latest changes."

659. Split Array into Consecutive Subsequences <https://leetcode.com/problems/split-array-into-consecutive-subsequences> "You are given an integer array sorted in ascending order (may contain duplicates), you need to split them into several subsequences, where each subsequences consist of at least 3 consecutive integers. Return whether you can make such a split."

Example 1:

Input: [1,2,3,3,4,5]
Output: True
Explanation:
You can split them into two consecutive subsequences :
1, 2, 3
3, 4, 5

Example 2:

Input: [1,2,3,3,4,4,5,5]

Output: True

Explanation:

You can split them into two consecutive subsequences :

1, 2, 3, 4, 5

3, 4, 5

Example 3:

Input: [1,2,3,4,4,5]

Output: False

Note:

The length of the input is in range of [1, 10000]"

661. Image Smoother <https://leetcode.com/problems/image-smoother> "Given a 2D integer matrix M representing the gray scale of an image, you need to design a smoother to make the gray scale of each cell becomes the average gray scale (rounding down) of all the 8 surrounding cells and itself. If a cell has less than 8 surrounding cells, then use as many as you can.

Example 1:

Input:

[[1,1,1],

[1,0,1],

[1,1,1]]

Output:

[[0, 0, 0],

[0, 0, 0],

[0, 0, 0]]

Explanation:

For the point (0,0), (0,2), (2,0), (2,2): $\text{floor}(3/4) = \text{floor}(0.75) = 0$

For the point (0,1), (1,0), (1,2), (2,1): $\text{floor}(5/6) = \text{floor}(0.83333333) = 0$

For the point (1,1): $\text{floor}(8/9) = \text{floor}(0.88888889) = 0$

Note:

The value in the given matrix is in the range of [0, 255].

The length and width of the given matrix are in the range of [1, 150]."

662. Maximum Width of Binary Tree <https://leetcode.com/problems/maximum-width-of-binary-tree> "Given a binary tree, write a function to get the maximum width of the given tree. The width of a tree is the maximum width among all levels. The binary tree has the same structure as a full binary tree, but some nodes are null.

The width of one level is defined as the length between the end-nodes (the leftmost and right most non-null nodes in the level, where the null nodes between the end-nodes are also counted into the length calculation.

Example 1:

Input:

Output: 4

Explanation: The maximum width existing in the third level with the length 4 (5,3,null,9).

Example 2:

Input:

Output: 2

Explanation: The maximum width existing in the third level with the length 2 (5,3).

Example 3:

Input:

Output: 2

Explanation: The maximum width existing in the second level with the length 2 (3,2).

Example 4:

Input:

Output: 8

Explanation: The maximum width existing in the fourth level with the length 8 (6,null,null,null,null,null,7).

Note:

Answer will in the range of 32-bit signed integer."

664. Strange Printer <https://leetcode.com/problems/strange-printer> "There is a strange printer with the following two special requirements:

The printer can only print a sequence of the same character each time.

At each turn, the printer can print new characters starting from and ending at any places, and will cover the original existing characters.

Given a string consists of lower English letters only, your job is to count the minimum number of turns the printer needed in order to print it.

Example 1:

Input: "aaabbb"

Output: 2

Explanation: Print "aaa" first and then print "bbb".

Example 2:

Input: "aba"

Output: 2

Explanation: Print "aaa" first and then print "b" from the second place of the string, which will cover the existing character 'a'.

Hint: Length of the given string will not exceed 100."

665. Non-decreasing Array <https://leetcode.com/problems/non-decreasing-array> "Given an array with n integers, your task is to check if it could become non-decreasing by modifying at most 1 element.

We define an array is non-decreasing if $\text{array}[i] \leq \text{array}[i + 1]$ holds for every i ($1 \leq i < n$).

Example 1:

Input: [4,2,3]

Output: True

Explanation: You could modify the first 4 to 1 to get a non-decreasing array.

Example 2:

Input: [4,2,1]

Output: False

Explanation: You can't get a non-decreasing array by modify at most one element.

Note:

The n belongs to [1, 10,000]."

667. Beautiful Arrangement II <https://leetcode.com/problems/beautiful-arrangement-ii> "Given two integers n and k, you need to construct a list which contains n different positive integers ranging from 1 to n and obeys the following requirement:

Suppose this list is $[a_1, a_2, a_3, \dots, a_n]$, then the list $[|a_1 - a_2|, |a_2 - a_3|, |a_3 - a_4|, \dots, |a_{n-1} - a_n|]$ has exactly k distinct integers.

If there are multiple answers, print any of them.

Example 1:

Input: n = 3, k = 1

Output: [1, 2, 3]

Explanation: The [1, 2, 3] has three different positive integers ranging from 1 to 3, and the [1, 1] has exactly 1 distinct integer: 1.

Example 2:

Input: n = 3, k = 2

Output: [1, 3, 2]

Explanation: The [1, 3, 2] has three different positive integers ranging from 1 to 3, and the [2, 1] has exactly 2 distinct integers: 1 and 2.

Note:

The n and k are in the range $1 \leq k < n \leq 104$."

668. Kth Smallest Number in Multiplication Table <https://leetcode.com/problems/kth-smallest-number-in-multiplication-table> "Nearly every one have used the Multiplication Table. But could you find out the k-th smallest number quickly from the multiplication table?"

Given the height m and the length n of a $m \times n$ Multiplication Table, and a positive integer k, you need to return the k-th smallest number in this table.

Example 1:

Input: m = 3, n = 3, k = 5

Output:

Explanation:

The Multiplication Table:

1	2	3
2	4	6
3	6	9

The 5-th smallest number is 3 (1, 2, 2, 3, 3).

Example 2:

Input: m = 2, n = 3, k = 6

Output:

Explanation:

The Multiplication Table:

1	2	3
2	4	6

The 6-th smallest number is 6 (1, 2, 2, 3, 4, 6).

Note:

The m and n will be in the range [1, 30000].

The k will be in the range [1, $m \times n$]"

669. Trim a Binary Search Tree <https://leetcode.com/problems/trim-a-binary-search-tree> "Given a binary search tree and the lowest and highest boundaries as L and R, trim the tree so that all its elements lies in [L, R] ($R \geq L$). You might need to change the root of the tree, so the result should return the new root of the trimmed binary search tree."

Example 1:

Input:

```

  1
 / \
0   2

```

L = 1
R = 2

Output:

```

  1
   \
    2

```

Example 2:

Input:

L = 1
R = 3

Output:

670. Maximum Swap <https://leetcode.com/problems/maximum-swap> "Given a non-negative integer, you could swap two digits at most once to get the maximum valued number. Return the maximum valued number you could get."

Example 1:

Input: 2736

Output: 7236

Explanation: Swap the number 2 and the number 7.

Example 2:

Input: 9973

Output: 9973

Explanation: No swap.

Note:

The given number is in the range $[0, 10^8]$.

671. Second Minimum Node In a Binary Tree <https://leetcode.com/problems/second-minimum-node-in-a-binary-tree> "Given a non-empty special binary tree consisting of nodes with the non-negative value, where each node in this tree has exactly two or zero sub-nodes. If the node has two sub-nodes, then this node's value is the smaller value among its two sub-nodes."

Given such a binary tree, you need to output the second minimum value in the set made of all the nodes' value in the whole tree.

If no such second minimum value exists, output -1 instead.

Example 1:

Input:

Output: 5

Explanation: The smallest value is 2, the second smallest value is 5.

Example 2:

Input:

```

  2
 / \
2   2

```

Output: -1

Explanation: The smallest value is 2, but there isn't any second smallest value."&
 672. Bulb Switcher II <https://leetcode.com/problems/bulb-switcher-ii> "There is a room with n lights which are turned on initially and 4 buttons on the wall. After performing exactly m unknown operations towards buttons, you need to return how many different kinds of status of the n lights could be.

Suppose n lights are labeled as number [1, 2, 3 ..., n], function of these 4 buttons are given below:

Flip all the lights.

Flip lights with even numbers.

Flip lights with odd numbers.

Flip lights with $(3k + 1)$ numbers, $k = 0, 1, 2, \dots$

Example 1:

Input: n = 1, m = 1.

Output: 2

Explanation: Status can be: [on], [off]

Example 2:

Input: n = 2, m = 1.

Output: 3

Explanation: Status can be: [on, off], [off, on], [off, off]

Example 3:

Input: n = 3, m = 1.

Output: 4

Explanation: Status can be: [off, on, off], [on, off, on], [off, off, off], [off, on, on].

Note:

n and m both fit in range [0, 1000]."&

673. Number of Longest Increasing Subsequence <https://leetcode.com/problems/number-of-longest-increasing-subsequence> "Given an unsorted array of integers, find the number of longest increasing subsequence.

Example 1:

Input: [1,3,5,4,7]

Output: 2

Explanation: The two longest increasing subsequence are [1, 3, 4, 7] and [1, 3, 5, 7].

Example 2:

Input: [2,2,2,2,2]

Output: 5

Explanation: The length of longest continuous increasing subsequence is 1, and there are 5 subsequences' length is 1, so output 5.

Note:

Length of the given array will be not exceed 2000 and the answer is guaranteed to be fit in 32-bit signed int."

674. Longest Continuous Increasing Subsequence <https://leetcode.com/problems/longest-continuous-increasing-subsequence> "Given an unsorted array of integers, find the length of longest continuous increasing subsequence (subarray).

Example 1:

Input: [1,3,5,4,7]

Output: 3

Explanation: The longest continuous increasing subsequence is [1,3,5], its length is 3.

Even though [1,3,5,7] is also an increasing subsequence, it's not a continuous one where 5 and 7 are separated by 4.

Example 2:

Input: [2,2,2,2,2]

Output: 1

Explanation: The longest continuous increasing subsequence is [2], its length is 1.

Note:

Length of the array will not exceed 10,000."

675. Cut Off Trees for Golf Event <https://leetcode.com/problems/cut-off-trees-for-golf-event> "You are asked to cut off trees in a forest for a golf event. The forest is represented as a non-negative 2D map, in this map:

0 represents the obstacle can't be reached.

1 represents the ground can be walked through.

The place with number bigger than 1 represents a tree can be walked through, and this positive number represents the tree's height.

You are asked to cut off all the trees in this forest in the order of tree's height - always cut off the tree with lowest height first. And after cutting, the original place has the tree will become a grass (value 1).

You will start from the point (0, 0) and you should output the minimum steps you need to walk to cut off all the trees. If you can't cut off all the trees, output -1 in that situation.

You are guaranteed that no two trees have the same height and there is at least one tree needs to be cut off.

Example 1:

Input:

```
[
  [1,2,3],
  [0,0,4],
  [7,6,5]
```

```
]
Output: 6
```

Example 2:

```
Input:
[
  [1,2,3],
  [0,0,0],
  [7,6,5]
]
Output: -1
```

Example 3:

```
Input:
[
  [2,3,4],
  [0,0,5],
  [8,7,6]
]
Output: 6
Explanation: You started from the point (0,0) and you can cut off the tree in (0,0)
directly without walking.
```

Hint: size of the given matrix will not exceed 50x50."

676. Implement Magic Dictionary <https://leetcode.com/problems/implement-magic-dictionary/> "Implement a magic directory with buildDict, and search methods.

For the method buildDict, you'll be given a list of non-repetitive words to build a dictionary.

For the method search, you'll be given a word, and judge whether if you modify exactly one character into another character in this word, the modified word is in the dictionary you just built.

Example 1:

```
Input: buildDict(["hello", "leetcode"]), Output: Null
Input: search("hello"), Output: False
Input: search("hhllo"), Output: True
Input: search("hell"), Output: False
Input: search("leetcoded"), Output: False
```

Note:

You may assume that all the inputs are consist of lowercase letters a-z.
 For contest purpose, the test data is rather small by now. You could think about highly efficient algorithm after the contest.
 Please remember to RESET your class variables declared in class MagicDictionary, as static/class variables are persisted across multiple test cases. Please see here for more details."

677. Map Sum Pairs <https://leetcode.com/problems/map-sum-pairs/> "Implement a MapSum class with insert, and sum methods.

For the method insert, you'll be given a pair of (string, integer). The string repre

sents the key and the integer represents the value. If the key already existed, then the original key-value pair will be overridden to the new one.

For the method sum, you'll be given a string representing the prefix, and you need to return the sum of all the pairs' value whose key starts with the prefix.

Example 1:

```
Input: insert("apple", 3), Output: Null
Input: sum("ap"), Output: 3
Input: insert("app", 2), Output: Null
Input: sum("ap"), Output: 5
```

678. Valid Parenthesis String <https://leetcode.com/problems/valid-parenthesis-string>
 "Given a string containing only three types of characters: '(', ')' and '*', write a function to check whether this string is valid. We define the validity of a string by these rules:

Any left parenthesis '(' must have a corresponding right parenthesis ')'.
 Any right parenthesis ')' must have a corresponding left parenthesis '('.
 Left parenthesis '(' must go before the corresponding right parenthesis ')'.
 '*' could be treated as a single right parenthesis ')' or a single left parenthesis '(' or an empty string.
 An empty string is also valid.

Example 1:

```
Input: "()"
Output: True
```

Example 2:

```
Input: "(*)"
Output: True
```

Example 3:

```
Input: "((*))"
Output: True
```

Note:

The string size will be in the range [1, 100]."
 679. 24 Game <https://leetcode.com/problems/24-game> "You have 4 cards each containing a number from 1 to 9. You need to judge whether they could be operated through *, /, +, -, (,) to get the value of 24."

Example 1:

```
Input: [4, 1, 8, 7]
Output: True
Explanation: (8-4) * (7-1) = 24
```

Example 2:

```
Input: [1, 2, 1, 2]
Output: False
```

Note:

The division operator `/` represents real division, not integer division. For example, $4 / (1 - 2/3) = 12$.

Every operation done is between two numbers. In particular, we cannot use `-` as a unary operator. For example, with `[1, 1, 1, 1]` as input, the expression `-1 - 1 - 1 - 1` is not allowed.

You cannot concatenate numbers together. For example, if the input is `[1, 2, 1, 2]`, we cannot write this as `12 + 12`.

680. Valid Palindrome II <https://leetcode.com/problems/valid-palindrome-ii> "Given a non-empty string `s`, you may delete at most one character. Judge whether you can make it a palindrome."

Example 1:

Input: `"aba"`

Output: True

Example 2:

Input: `"abca"`

Output: True

Explanation: You could delete the character `'c'`.

Note:

The string will only contain lowercase characters `a-z`.

The maximum length of the string is 50000.

682. Baseball Game <https://leetcode.com/problems/baseball-game> "You're now a baseball game point recorder."

Given a list of strings, each string can be one of the 4 following types:

Integer (one round's score): Directly represents the number of points you get in this round.

`"+"` (one round's score): Represents that the points you get in this round are the sum of the last two valid round's points.

`"D"` (one round's score): Represents that the points you get in this round are the doubled data of the last valid round's points.

`"C"` (an operation, which isn't a round's score): Represents the last valid round's points you get were invalid and should be removed.

Each round's operation is permanent and could have an impact on the round before and the round after.

You need to return the sum of the points you could get in all the rounds.

Example 1:

Input: `["5","2","C","D","+"]`

Output: 30

Explanation:

Round 1: You could get 5 points. The sum is: 5.

Round 2: You could get 2 points. The sum is: 7.

Operation 1: The round 2's data was invalid. The sum is: 5.

Round 3: You could get 10 points (the round 2's data has been removed). The sum is: 15.

Round 4: You could get $5 + 10 = 15$ points. The sum is: 30.

Example 2:

Input: ["5", "-2", "4", "C", "D", "9", "+", "+"]

Output: 27

Explanation:

Round 1: You could get 5 points. The sum is: 5.

Round 2: You could get -2 points. The sum is: 3.

Round 3: You could get 4 points. The sum is: 7.

Operation 1: The round 3's data is invalid. The sum is: 3.

Round 4: You could get -4 points (the round 3's data has been removed). The sum is: -1.

Round 5: You could get 9 points. The sum is: 8.

Round 6: You could get $-4 + 9 = 5$ points. The sum is 13.

Round 7: You could get $9 + 5 = 14$ points. The sum is 27.

Note:

The size of the input list will be between 1 and 1000.

Every integer represented in the list will be between -30000 and 30000."

684. Redundant Connection <https://leetcode.com/problems/redundant-connection> "In this problem, a tree is an undirected graph that is connected and has no cycles.

The given input is a graph that started as a tree with N nodes (with distinct values $1, 2, \dots, N$), with one additional edge added. The added edge has two different vertices chosen from 1 to N , and was not an edge that already existed.

The resulting graph is given as a 2D-array of edges. Each element of edges is a pair $[u, v]$ with $u < v$, that represents an undirected edge connecting nodes u and v .

Return an edge that can be removed so that the resulting graph is a tree of N nodes.

If there are multiple answers, return the answer that occurs last in the given 2D-array. The answer edge $[u, v]$ should be in the same format, with $u < v$.

Example 1:

Input: [[1,2], [1,3], [2,3]]

Output: [2,3]

Explanation: The given undirected graph will be like this:

```

  1
 / \
2 - 3

```

Example 2:

Input: [[1,2], [2,3], [3,4], [1,4], [1,5]]

Output: [1,4]

Explanation: The given undirected graph will be like this:

```

5 - 1 - 2
   |   |
   4 - 3

```

Note:

The size of the input 2D-array will be between 3 and 1000.

Every integer represented in the 2D-array will be between 1 and N , where N is the size of the input array.

Update (2017-09-26):

We have overhauled the problem description + test cases and specified clearly the graph is an undirected graph. For the directed graph follow up please see Redundant Co

nnection II). We apologize for any inconvenience caused."¿
 685. Redundant Connection II <https://leetcode.com/problems/redundant-connection-ii> "In this problem, a rooted tree is a directed graph such that, there is exactly one node (the root) for which all other nodes are descendants of this node, plus every node has exactly one parent, except for the root node which has no parents.

The given input is a directed graph that started as a rooted tree with N nodes (with distinct values 1, 2, ..., N), with one additional directed edge added. The added edge has two different vertices chosen from 1 to N, and was not an edge that already existed.

The resulting graph is given as a 2D-array of edges. Each element of edges is a pair [u, v] that represents a directed edge connecting nodes u and v, where u is a parent of child v.

Return an edge that can be removed so that the resulting graph is a rooted tree of N nodes. If there are multiple answers, return the answer that occurs last in the given 2D-array.

Example 1:

Input: [[1,2], [1,3], [2,3]]

Output: [2,3]

Explanation: The given directed graph will be like this:

```

  1
 / \
v   v
2-->3

```

Example 2:

Input: [[1,2], [2,3], [3,4], [4,1], [1,5]]

Output: [4,1]

Explanation: The given directed graph will be like this:

```

5 <- 1 -> 2
      ^   |
      |   v
      4 <- 3

```

Note:

The size of the input 2D-array will be between 3 and 1000.

Every integer represented in the 2D-array will be between 1 and N, where N is the size of the input array."¿

686. Repeated String Match <https://leetcode.com/problems/repeated-string-match> "Given two strings A and B, find the minimum number of times A has to be repeated such that B is a substring of it. If no such solution, return -1.

For example, with A = "abcd" and B = "cdababcdab".

Return 3, because by repeating A three times (¿abcdababcd¿), B is a substring of it; and B is not a substring of A repeated two times ("abcdabcd").

Note:

The length of A and B will be between 1 and 10000."¿

687. Longest Univalue Path <https://leetcode.com/problems/longest-univalue-path> "Given a binary tree, find the length of the longest path where each node in the path has the same value. This path may or may not pass through the root.

Note: The length of path between two nodes is represented by the number of edges between them.

Example 1:

Input:

Output:

2

Example 2:

Input:

Output:

2

Note:

The given binary tree has not more than 10000 nodes. The height of the tree is not more than 1000."

688. Knight Probability in Chessboard <https://leetcode.com/problems/knight-probability-in-chessboard> "On an NxN chessboard, a knight starts at the r-th row and c-th column and attempts to make exactly K moves. The rows and columns are 0 indexed, so the top-left square is (0, 0), and the bottom-right square is (N-1, N-1).

A chess knight has 8 possible moves it can make, as illustrated below. Each move is two squares in a cardinal direction, then one square in an orthogonal direction.

Each time the knight is to move, it chooses one of eight possible moves uniformly at random (even if the piece would go off the chessboard) and moves there.

The knight continues moving until it has made exactly K moves or has moved off the chessboard. Return the probability that the knight remains on the board after it has stopped moving.

Example:

Input: 3, 2, 0, 0

Output: 0.0625

Explanation: There are two moves (to (1,2), (2,1)) that will keep the knight on the board.

From each of those positions, there are also two moves that will keep the knight on the board.

The total probability the knight stays on the board is 0.0625.

Note:

N will be between 1 and 25.

K will be between 0 and 100.

The knight always initially starts on the board."

689. Maximum Sum of 3 Non-Overlapping Subarrays <https://leetcode.com/problems/maximum-sum-of-3-non-overlapping-subarrays> "In a given array nums of positive integers, find three non-overlapping subarrays with maximum sum.

Each subarray will be of size k, and we want to maximize the sum of all 3*k entries.

Return the result as a list of indices representing the starting position of each interval (0-indexed). If there are multiple answers, return the lexicographically smallest one.

Example:

Input: [1,2,1,2,6,7,5,1], 2

Output: [0, 3, 5]

Explanation: Subarrays [1, 2], [2, 6], [7, 5] correspond to the starting indices [0, 3, 5].

We could have also taken [2, 1], but an answer of [1, 3, 5] would be lexicographically larger.

Note:

nums.length will be between 1 and 20000.

nums[i] will be between 1 and 65535.

k will be between 1 and floor(nums.length / 3)."

690. Employee Importance <https://leetcode.com/problems/employee-importance> "You are given a data structure of employee information, which includes the employee's unique id, his importance value and his direct subordinates' id.

For example, employee 1 is the leader of employee 2, and employee 2 is the leader of employee 3. They have importance value 15, 10 and 5, respectively. Then employee 1 has a data structure like [1, 15, [2]], and employee 2 has [2, 10, [3]], and employee 3 has [3, 5, []]. Note that although employee 3 is also a subordinate of employee 1, the relationship is not direct.

Now given the employee information of a company, and an employee id, you need to return the total importance value of this employee and all his subordinates.

Example 1:

Input: [[1, 5, [2, 3]], [2, 3, []], [3, 3, []]], 1

Output: 11

Explanation:

Employee 1 has importance value 5, and he has two direct subordinates: employee 2 and employee 3. They both have importance value 3. So the total importance value of employee 1 is 5 + 3 + 3 = 11.

Note:

One employee has at most one direct leader and may have several subordinates.

The maximum number of employees won't exceed 2000."

691. Stickers to Spell Word <https://leetcode.com/problems/stickers-to-spell-word>

"We are given N different types of stickers. Each sticker has a lowercase English word on it.

You would like to spell out the given target string by cutting individual letters from your collection of stickers and rearranging them.

You can use each sticker more than once if you want, and you have infinite quantities of each sticker.

What is the minimum number of stickers that you need to spell out the target? If the task is impossible, return -1.

Example 1:

Input: ["with", "example", "science"], "thehat"

Output: 3

Explanation: We can use 2 "with" stickers, and 1 "example" sticker. After cutting and rearrange the letters of those stickers, we can form the target "thehat". Also, this is the minimum number of stickers necessary to form the target string.

Example 2:

Input: ["notice", "possible"], "basicbasic"

Output: -1

Explanation: We can't form the target "basicbasic" from cutting letters from the given stickers.

Note:

stickers has length in the range [1, 50].

stickers consists of lowercase English words (without apostrophes).

target has length in the range [1, 15], and consists of lowercase English letters.

In all test cases, all words were chosen randomly from the 1000 most common US English words, and the target was chosen as a concatenation of two random words.

The time limit may be more challenging than usual. It is expected that a 50 sticker test case can be solved within 35ms on average."

692. Top K Frequent Words <https://leetcode.com/problems/top-k-frequent-words> "Given a non-empty list of words, return the k most frequent elements."

Your answer should be sorted by frequency from highest to lowest. If two words have the same frequency, then the word with the lower alphabetical order comes first.

Example 1:

Input: ["i", "love", "leetcode", "i", "love", "coding"], k = 2

Output: ["i", "love"]

Explanation: "i" and "love" are the two most frequent words.

Note that "i" comes before "love" due to a lower alphabetical order.

Example 2:

Input: ["the", "day", "is", "sunny", "the", "the", "the", "sunny", "is", "is"], k = 4

Output: ["the", "is", "sunny", "day"]

Explanation: "the", "is", "sunny" and "day" are the four most frequent words with the number of occurrence being 4, 3, 2 and 1 respectively.

Note:

You may assume k is always valid, $1 \leq k \leq$ number of unique elements.

Input words contain only lowercase letters.

Follow up:

Try to solve it in $O(n \log k)$ time and $O(n)$ extra space."?

693. Binary Number with Alternating Bits <https://leetcode.com/problems/binary-number-with-alternating-bits> "Given a positive integer, check whether it has alternating bits: namely, if two adjacent bits will always have different values."

Example 1:

Input: 5
 Output: True
 Explanation:
 The binary representation of 5 is: 101

Example 2:

Input: 7
 Output: False
 Explanation:
 The binary representation of 7 is: 111.

Example 3:

Input: 11
 Output: False
 Explanation:
 The binary representation of 11 is: 1011.

Example 4:

Input: 10
 Output: True
 Explanation:
 The binary representation of 10 is: 1010."?

695. Max Area of Island <https://leetcode.com/problems/max-area-of-island> "Given a non-empty 2D array grid of 0's and 1's, an island is a group of 1's (representing land) connected 4-directionally (horizontal or vertical.) You may assume all four edges of the grid are surrounded by water."

Find the maximum area of an island in the given 2D array.
 (If there is no island, the maximum area is 0.)

Example 1:

```
[[0,0,1,0,0,0,0,1,0,0,0,0,0],
 [0,0,0,0,0,0,0,1,1,1,0,0,0],
 [0,1,1,0,1,0,0,0,0,0,0,0,0],
 [0,1,0,0,1,1,0,0,1,0,1,0,0],
 [0,1,0,0,1,1,0,0,1,1,1,0,0],
 [0,0,0,0,0,0,0,0,0,0,1,0,0],
 [0,0,0,0,0,0,0,1,1,1,0,0,0],
 [0,0,0,0,0,0,0,1,1,0,0,0,0]]
```

Given the above grid, return 6.

Note the answer is not 11, because the island must be connected 4-directionally.

Example 2:

```
[[0,0,0,0,0,0,0,0]]
```

Given the above grid, return 0.

Note:

The length of each dimension in the given grid does not exceed 50."?

696. Count Binary Substrings <https://leetcode.com/problems/count-binary-substrings> "Give a string s, count the number of non-empty (contiguous) substrings that have the same number of 0's and 1's, and all the 0's and all the 1's in these substring

s are grouped consecutively.

Substrings that occur multiple times are counted the number of times they occur.

Example 1:

Input: "00110011"

Output: 6

Explanation: There are 6 substrings that have equal number of consecutive 1's and 0's: "0011", "01", "1100", "10", "0011", and "01".

Notice that some of these substrings repeat and are counted the number of times they occur.

Also, "00110011" is not a valid substring because all the 0's (and 1's) are not grouped together.

Example 2:

Input: "10101"

Output: 4

Explanation: There are 4 substrings: "10", "01", "10", "01" that have equal number of consecutive 1's and 0's.

Note:

s.length will be between 1 and 50,000.

s will only consist of "0" or "1" characters."

697. Degree of an Array <https://leetcode.com/problems/degree-of-an-array> "Given a non-empty array of non-negative integers nums, the degree of this array is defined as the maximum frequency of any one of its elements.

Your task is to find the smallest possible length of a (contiguous) subarray of nums, that has the same degree as nums.

Example 1:

Input: [1, 2, 2, 3, 1]

Output: 2

Explanation:

The input array has a degree of 2 because both elements 1 and 2 appear twice.

Of the subarrays that have the same degree:

[1, 2, 2, 3, 1], [1, 2, 2, 3], [2, 2, 3, 1], [1, 2, 2], [2, 2, 3], [2, 2]

The shortest length is 2. So return 2.

Example 2:

Input: [1,2,2,3,1,4,2]

Output: 6

Note:

nums.length will be between 1 and 50,000.

nums[i] will be an integer between 0 and 49,999."

698. Partition to K Equal Sum Subsets <https://leetcode.com/problems/partition-to-k-equal-sum-subsets> "Given an array of integers nums and a positive integer k, find whether it's possible to divide this array into k non-empty subsets whose sums are all equal.

Example 1:

Input: nums = [4, 3, 2, 3, 5, 2, 1], k = 4

Output: True

Explanation: It's possible to divide it into 4 subsets (5), (1, 4), (2,3), (2,3) with equal sums.

Note:

```
1 <= k <= len(nums) <= 16.
```

```
0 < nums[i] < 10000."
```

699. Falling Squares <https://leetcode.com/problems/falling-squares> "On an infinite number line (x-axis), we drop given squares in the order they are given.

The i-th square dropped (positions[i] = (left, side_length)) is a square with the left-most point being positions[i][0] and sidelength positions[i][1].

The square is dropped with the bottom edge parallel to the number line, and from a higher height than all currently landed squares. We wait for each square to stick before dropping the next.

The squares are infinitely sticky on their bottom edge, and will remain fixed to any positive length surface they touch (either the number line or another square). Squares dropped adjacent to each other will not stick together prematurely.

Return a list ans of heights. Each height ans[i] represents the current highest height of any square we have dropped, after dropping squares represented by positions[0], positions[1], ..., positions[i].

Example 1:

Input: [[1, 2], [2, 3], [6, 1]]

Output: [2, 5, 5]

Explanation:

After the first drop of positions[0] = [1, 2]:

```
_aa
_aa
-----
```

The maximum height of any square is 2.

After the second drop of positions[1] = [2, 3]:

```
_aaa
_aaa
_aaa
_aa
_aa
_aa
-----
```

The maximum height of any square is 5.

The larger square stays on top of the smaller square despite where its center of gravity is, because squares are infinitely sticky on their bottom edge.

After the third drop of positions[2] = [6, 1]:

```
_aaa
_aaa
_aaa
_aa
_aa_a
-----
```

The maximum height of any square is still 5.

Thus, we return an answer of [2, 5, 5].

Example 2:

Input: [[100, 100], [200, 100]]

Output: [100, 100]

Explanation: Adjacent squares don't get stuck prematurely - only their bottom edge can stick to surfaces.

Note:

```
1 <= positions.length <= 1000.
```

```
1 <= positions[i][0] <= 10^8.
```

1 <= positions[i][1] <= 10⁶."}

712. Minimum ASCII Delete Sum for Two Strings <https://leetcode.com/problems/minimum-ascii-delete-sum-for-two-strings> "Given two strings s1, s2, find the lowest ASCII sum of deleted characters to make two strings equal."

Example 1:

Input: s1 = "sea", s2 = "eat"

Output: 231

Explanation: Deleting "s" from "sea" adds the ASCII value of "s" (115) to the sum.

Deleting "t" from "eat" adds 116 to the sum.

At the end, both strings are equal, and 115 + 116 = 231 is the minimum sum possible to achieve this.

Example 2:

Input: s1 = "delete", s2 = "leet"

Output: 403

Explanation: Deleting "dee" from "delete" to turn the string into "let", adds 100[d]+101[e]+101[e] to the sum. Deleting "e" from "leet" adds 101[e] to the sum.

At the end, both strings are equal to "let", and the answer is 100+101+101+101 = 403.

If instead we turned both strings into "lee" or "eet", we would get answers of 433 or 417, which are higher.

Note:

0 < s1.length, s2.length <= 1000.

All elements of each string will have an ASCII value in [97, 122]."

713. Subarray Product Less Than K <https://leetcode.com/problems/subarray-product-less-than-k> "Your are given an array of positive integers nums. Count and print the number of (contiguous) subarrays where the product of all the elements in the subarray is less than k."

Example 1:

Input: nums = [10, 5, 2, 6], k = 100

Output: 8

Explanation: The 8 subarrays that have product less than 100 are: [10], [5], [2], [6], [10, 5], [5, 2], [2, 6], [5, 2, 6].

Note that [10, 5, 2] is not included as the product of 100 is not strictly less than k.

Note:

0 < nums.length <= 50000.

0 < nums[i] < 1000.

0 <= k < 10⁶."

714. Best Time to Buy and Sell Stock with Transaction Fee <https://leetcode.com/problems/best-time-to-buy-and-sell-stock-with-transaction-fee> "Your are given an array of integers prices, for which the i-th element is the price of a given stock on day i; and a non-negative integer fee representing a transaction fee. You may complete as many transactions as you like, but you need to pay the transaction fee for each transaction. You may not buy more than 1 share of a stock at a time (ie. you must sell the stock share before you buy again.) Return the maximum profit you can make."

Example 1:

Input: prices = [1, 3, 2, 8, 4, 9], fee = 2

Output: 8

Explanation: The maximum profit can be achieved by: Buying at prices[0] = 1 Selling at prices[3] = 8 Buying at prices[4] = 4 Selling at prices[5] = 9 The total profit is ((8 - 1) - 2) + ((9 - 4) - 2) = 8.

Note:

`0 < prices.length <= 50000.`

`0 < prices[i] < 50000.`

`0 <= fee < 50000."`

715. Range Module <https://leetcode.com/problems/range-module> "A Range Module is a module that tracks ranges of numbers. Your task is to design and implement the following interfaces in an efficient manner.

`addRange(int left, int right)` Adds the half-open interval `[left, right)`, tracking every real number in that interval. Adding an interval that partially overlaps with currently tracked numbers should add any numbers in the interval `[left, right)` that are not already tracked.

`queryRange(int left, int right)` Returns true if and only if every real number in the interval `[left, right)` is currently being tracked.

`removeRange(int left, int right)` Stops tracking every real number currently being tracked in the interval `[left, right)`.

Example 1:

`addRange(10, 20): null`

`removeRange(14, 16): null`

`queryRange(10, 14): true` (Every number in `[10, 14)` is being tracked)

`queryRange(13, 15): false` (Numbers like 14, 14.03, 14.17 in `[13, 15)` are not being tracked)

`queryRange(16, 17): true` (The number 16 in `[16, 17)` is still being tracked, despite the remove operation)

Note:

A half open interval `[left, right)` denotes all real numbers `left <= x < right`.

`0 < left < right < 10^9` in all calls to `addRange`, `queryRange`, `removeRange`.

The total number of calls to `addRange` in a single test case is at most 1000.

The total number of calls to `queryRange` in a single test case is at most 5000.

The total number of calls to `removeRange` in a single test case is at most 1000."

717. 1-bit and 2-bit Characters <https://leetcode.com/problems/1-bit-and-2-bit-characters> "We have two special characters. The first character can be represented by one bit 0. The second character can be represented by two bits (10 or 11).

Now given a string represented by several bits. Return whether the last character must be a one-bit character or not. The given string will always end with a zero.

Example 1:

Input:

`bits = [1, 0, 0]`

Output: True

Explanation:

The only way to decode it is two-bit character and one-bit character. So the last character is one-bit character.

Example 2:

Input:

`bits = [1, 1, 1, 0]`

Output: False

Explanation:

The only way to decode it is two-bit character and two-bit character. So the last character is NOT one-bit character.

Note:

`1 <= len(bits) <= 1000.`

`bits[i]` is always 0 or 1."

718. Maximum Length of Repeated Subarray <https://leetcode.com/problems/maximum-length-of-repeated-subarray> "Given two integer arrays A and B, return the maximum length of the longest common subarray."

ngth of an subarray that appears in both arrays.

Example 1:

Input:

A: [1,2,3,2,1]

B: [3,2,1,4,7]

Output: 3

Explanation:

The repeated subarray with maximum length is [3, 2, 1].

Note:

1 <= len(A), len(B) <= 1000

0 <= A[i], B[i] < 100"

719. Find K-th Smallest Pair Distance <https://leetcode.com/problems/find-k-th-smallest-pair-distance> "Given an integer array, return the k-th smallest distance among all the pairs. The distance of a pair (A, B) is defined as the absolute difference between A and B.

Example 1:

Input:

nums = [1,3,1]

k = 1

Output: 0

Explanation:

Here are all the pairs:

(1,3) -> 2

(1,1) -> 0

(3,1) -> 2

Then the 1st smallest distance pair is (1,1), and its distance is 0.

Note:

2 <= len(nums) <= 10000.

0 <= nums[i] < 1000000.

1 <= k <= len(nums) * (len(nums) - 1) / 2."

720. Longest Word in Dictionary <https://leetcode.com/problems/longest-word-in-dictionary> "Given a list of strings words representing an English Dictionary, find the longest word in words that can be built one character at a time by other words in words. If there is more than one possible answer, return the longest word with the smallest lexicographical order. If there is no answer, return the empty string.

Example 1:

Input:

words = ["w","wo","wor","worl","world"]

Output: "world"

Explanation:

The word "world" can be built one character at a time by "w", "wo", "wor", and "worl".

Example 2:

Input:

words = ["a","banana","app","appl","ap","apply","apple"]

Output: "apple"

Explanation:

Both "apply" and "apple" can be built from other words in the dictionary. However, "apple" is lexicographically smaller than "apply".

Note:

All the strings in the input will only contain lowercase letters.

The length of words will be in the range [1, 1000].

The length of words[i] will be in the range [1, 30]."

721. Accounts Merge <https://leetcode.com/problems/accounts-merge> "Given a list accounts, each element accounts[i] is a list of strings, where the first element accounts[i][0] is a name, and the rest of the elements are emails representing emails of the account.

Now, we would like to merge these accounts. Two accounts definitely belong to the same person if there is some email that is common to both accounts. Note that even if two accounts have the same name, they may belong to different people as people could have the same name. A person can have any number of accounts initially, but all of their accounts definitely have the same name.

After merging the accounts, return the accounts in the following format: the first element of each account is the name, and the rest of the elements are emails in sorted order. The accounts themselves can be returned in any order.

Example 1:

Input:

```
accounts = [{"John", "johnsmith@mail.com", "john00@mail.com"}, {"John", "johnnybravo@mail.com"}, {"John", "johnsmith@mail.com", "john_newyork@mail.com"}, {"Mary", "mary@mail.com"}]
```

```
Output: [{"John", 'john00@mail.com', 'john_newyork@mail.com', 'johnsmith@mail.com'}, {"John", "johnnybravo@mail.com"}, {"Mary", "mary@mail.com"}]
```

Explanation:

The first and third John's are the same person as they have the common email "johnsmith@mail.com".

The second John and Mary are different people as none of their email addresses are used by other accounts.

We could return these lists in any order, for example the answer [['Mary', 'mary@mail.com'], ['John', 'johnnybravo@mail.com'], ['John', 'john00@mail.com', 'john_newyork@mail.com', 'johnsmith@mail.com']] would still be accepted.

Note:

The length of accounts will be in the range [1, 1000].

The length of accounts[i] will be in the range [1, 10].

The length of accounts[i][j] will be in the range [1, 30]."

722. Remove Comments <https://leetcode.com/problems/remove-comments> "Given a C++ program, remove comments from it. The program source is an array where source[i] is the i-th line of the source code. This represents the result of splitting the original source code string by the newline character \n.

In C++, there are two types of comments, line comments, and block comments.

The string // denotes a line comment, which represents that it and rest of the characters to the right of it in the same line should be ignored.

The string /* denotes a block comment, which represents that all characters until the next (non-overlapping) occurrence of */ should be ignored. (Here, occurrences happen in reading order: line by line from left to right.) To be clear, the string /* does not yet end the block comment, as the ending would be overlapping the beginning.

The first effective comment takes precedence over others: if the string // occurs in a block comment, it is ignored. Similarly, if the string /* occurs in a line or block comment, it is also ignored.

If a certain line of code is empty after removing comments, you must not output that line: each string in the answer list will be non-empty.

There will be no control characters, single quote, or double quote characters. For example, source = "\"string s = \"\"/* Not a comment. */\"\";" will not be a test case. (Also, nothing else such as defines or macros will interfere with the comments.)

It is guaranteed that every open block comment will eventually be closed, so /* outside of a line or block comment always starts a new comment.

Finally, implicit newline characters can be deleted by block comments. Please see t

he examples below for details.

After removing the comments from the source code, return the source code in the same format.

Example 1:

Input:
 source = ["/*Test program */", "int main()", "{ ", " // variable declaration", "int a, b, c;", "/* This is a test", "multiline ", " comment for ", "testing */", "a = b + c;", "}"]

The line by line code is visualized as below:

```
/*Test program */
int main()
{
    // variable declaration
    int a, b, c;
    /* This is a test
       multiline
       comment for
       testing */
    a = b + c;
}
```

Output: ["int main()", "{ ", "int a, b, c;", "a = b + c;", "}"]

The line by line code is visualized as below:

```
int main()
{

int a, b, c;
a = b + c;
}
```

Explanation:

The string /* denotes a block comment, including line 1 and lines 6-9. The string // denotes line 4 as comments.

Example 2:

Input:
 source = ["a/*comment", "line", "more_comment*/b"]

Output: ["ab"]

Explanation: The original source string is "a/*comment\nline\nmore_comment*/b", where we have bolded the newline characters. After deletion, the implicit newline characters are deleted, leaving the string "ab", which when delimited by newline characters becomes ["ab"].

Note:

The length of source is in the range [1, 100].

The length of source[i] is in the range [0, 80].

Every open block comment is eventually closed.

There are no single-quote, double-quote, or control characters in the source code."2724. Find Pivot Index <https://leetcode.com/problems/find-pivot-index> "Given an array of integers nums, write a method that returns the "pivot" index of this array.

We define the pivot index as the index where the sum of the numbers to the left of the index is equal to the sum of the numbers to the right of the index.

If no such index exists, we should return -1. If there are multiple pivot indexes, you should return the left-most pivot index.

Example 1:

Input:
 nums = [1, 7, 3, 6, 5, 6]

Output: 3

Explanation:

The sum of the numbers to the left of index 3 (nums[3] = 6) is equal to the sum of numbers to the right of index 3.

Also, 3 is the first index where this occurs.

Example 2:

Input:

nums = [1, 2, 3]

Output: -1

Explanation:

There is no index that satisfies the conditions in the problem statement.

Note:

The length of nums will be in the range [0, 10000].

Each element nums[i] will be an integer in the range [-1000, 1000]."

725. Split Linked List in Parts <https://leetcode.com/problems/split-linked-list-in-parts> "Given a (singly) linked list with head node root, write a function to split the linked list into k consecutive linked list "parts".

The length of each part should be as equal as possible: no two parts should have a size differing by more than 1. This may lead to some parts being null.

The parts should be in order of occurrence in the input list, and parts occurring earlier should always have a size greater than or equal parts occurring later.

Return a List of ListNode's representing the linked list parts that are formed.

Examples

1->2->3->4, k = 5 // 5 equal parts

```
[ [1],
  [2],
  [3],
  [4],
  null ]
```

Example 1:

Input:

root = [1, 2, 3], k = 5

Output: [[1],[2],[3],[],[]]

Explanation:

The input and each element of the output are ListNodes, not arrays.

For example, the input root has root.val = 1, root.next.val = 2, \root.next.next.val = 3, and root.next.next.next = null.

The first element output[0] has output[0].val = 1, output[0].next = null.

The last element output[4] is null, but it's string representation as a ListNode is [].

Example 2:

Input:

root = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10], k = 3

Output: [[1, 2, 3, 4], [5, 6, 7], [8, 9, 10]]

Explanation:

The input has been split into consecutive parts with size difference at most 1, and earlier parts are a larger size than the later parts.

Note:

The length of root will be in the range [0, 1000].

Each value of a node in the input will be an integer in the range [0, 999].

k will be an integer in the range [1, 50]."

726. Number of Atoms <https://leetcode.com/problems/number-of-atoms> "Given a che

mical formula (given as a string), return the count of each atom.

An atomic element always starts with an uppercase character, then zero or more lower case letters, representing the name.

1 or more digits representing the count of that element may follow if the count is greater than 1. If the count is 1, no digits will follow. For example, H2O and H2O2 are possible, but H1O2 is impossible.

Two formulas concatenated together produce another formula. For example, H2O2He3Mg4 is also a formula.

A formula placed in parentheses, and a count (optionally added) is also a formula. For example, (H2O2) and (H2O2)3 are formulas.

Given a formula, output the count of all elements as a string in the following form: the first name (in sorted order), followed by its count (if that count is more than 1), followed by the second name (in sorted order), followed by its count (if that count is more than 1), and so on.

Example 1:

Input:
formula = "H2O"
Output: "H2O"
Explanation:
The count of elements are {'H': 2, 'O': 1}.

Example 2:

Input:
formula = "Mg(OH)2"
Output: "H2MgO2"
Explanation:
The count of elements are {'H': 2, 'Mg': 1, 'O': 2}.

Example 3:

Input:
formula = "K4(ON(SO3)2)2"
Output: "K4N2O14S4"
Explanation:
The count of elements are {'K': 4, 'N': 2, 'O': 14, 'S': 4}.

Note:

All atom names consist of lowercase letters, except for the first character which is uppercase.

The length of formula will be in the range [1, 1000].

formula will only consist of letters, digits, and round parentheses, and is a valid formula as defined in the problem."

728. Self Dividing Numbers <https://leetcode.com/problems/self-dividing-numbers> "A self-dividing number is a number that is divisible by every digit it contains.

For example, 128 is a self-dividing number because $128 \% 1 == 0$, $128 \% 2 == 0$, and $128 \% 8 == 0$.

Also, a self-dividing number is not allowed to contain the digit zero.

Given a lower and upper number bound, output a list of every possible self dividing number, including the bounds if possible.

Example 1:

Input:
left = 1, right = 22
Output: [1, 2, 3, 4, 5, 6, 7, 8, 9, 11, 12, 15, 22]

1 modulo $10^9 + 7$.

Note:

The length of S will be in the range [1, 1000].

Each character S[i] will be in the set {'a', 'b', 'c', 'd'}."¿

731. My Calendar II <https://leetcode.com/problems/my-calendar-ii> "Implement a MyCalendarTwo class to store your events. A new event can be added if adding the event will not cause a triple booking.

Your class will have one method, book(int start, int end). Formally, this represents a booking on the half open interval [start, end), the range of real numbers x such that start ≤ x < end.

A triple booking happens when three events have some non-empty intersection (ie., there is some time that is common to all 3 events.)

For each call to the method MyCalendar.book, return true if the event can be added to the calendar successfully without causing a triple booking. Otherwise, return false and do not add the event to the calendar.

Your class will be called like this:

```
MyCalendar cal = new MyCalendar();
MyCalendar.book(start, end)
```

Example 1:

```
MyCalendar();
MyCalendar.book(10, 20); // returns true
MyCalendar.book(50, 60); // returns true
MyCalendar.book(10, 40); // returns true
MyCalendar.book(5, 15); // returns false
MyCalendar.book(5, 10); // returns true
MyCalendar.book(25, 55); // returns true
```

Explanation:

The first two events can be booked. The third event can be double booked.

The fourth event (5, 15) can't be booked, because it would result in a triple booking.

The fifth event (5, 10) can be booked, as it does not use time 10 which is already double booked.

The sixth event (25, 55) can be booked, as the time in [25, 40) will be double booked with the third event;

the time [40, 50) will be single booked, and the time [50, 55) will be double booked with the second event.

Note:

The number of calls to MyCalendar.book per test case will be at most 1000.

In calls to MyCalendar.book(start, end), start and end are integers in the range [0, 10^9]."¿

732. My Calendar III <https://leetcode.com/problems/my-calendar-iii> "Implement a MyCalendarThree class to store your events. A new event can always be added.

Your class will have one method, book(int start, int end). Formally, this represents a booking on the half open interval [start, end), the range of real numbers x such that start ≤ x < end.

A K-booking happens when K events have some non-empty intersection (ie., there is some time that is common to all K events.)

For each call to the method MyCalendar.book, return an integer K representing the largest integer such that there exists a K-booking in the calendar.

Your class will be called like this:

```
MyCalendarThree cal = new MyCalendarThree();
MyCalendarThree.book(start, end)
```

Example 1:

```
MyCalendarThree();
MyCalendarThree.book(10, 20); // returns 1
MyCalendarThree.book(50, 60); // returns 1
MyCalendarThree.book(10, 40); // returns 2
MyCalendarThree.book(5, 15); // returns 3
MyCalendarThree.book(5, 10); // returns 3
MyCalendarThree.book(25, 55); // returns 3
```

Explanation:

The first two events can be booked and are disjoint, so the maximum K-booking is a 1-booking.

The third event [10, 40) intersects the first event, and the maximum K-booking is a 2-booking.

The remaining events cause the maximum K-booking to be only a 3-booking.

Note that the last event locally causes a 2-booking, but the answer is still 3 because

eg. [10, 20), [10, 40), and [5, 15) are still triple booked.

Note:

The number of calls to MyCalendarThree.book per test case will be at most 400.

In calls to MyCalendarThree.book(start, end), start and end are integers in the range $[0, 10^9]$.

733. Flood Fill <https://leetcode.com/problems/flood-fill> "An image is represented by a 2-D array of integers, each integer representing the pixel value of the image (from 0 to 65535).

Given a coordinate (sr, sc) representing the starting pixel (row and column) of the flood fill, and a pixel value newColor, "flood fill" the image.

To perform a "flood fill", consider the starting pixel, plus any pixels connected 4-directionally to the starting pixel of the same color as the starting pixel, plus any pixels connected 4-directionally to those pixels (also with the same color as the starting pixel), and so on. Replace the color of all of the aforementioned pixels with the newColor.

At the end, return the modified image.

Example 1:

Input:

```
image = [[1,1,1],[1,1,0],[1,0,1]]
```

```
sr = 1, sc = 1, newColor = 2
```

```
Output: [[2,2,2],[2,2,0],[2,0,1]]
```

Explanation:

From the center of the image (with position (sr, sc) = (1, 1)), all pixels connected

by a path of the same color as the starting pixel are colored with the new color.

Note the bottom corner is not colored 2, because it is not 4-directionally connected to the starting pixel.

Note:

The length of image and image[0] will be in the range [1, 50].

The given starting pixel will satisfy $0 \leq sr < \text{image.length}$ and $0 \leq sc < \text{image[0].length}$.

The value of each color in image[i][j] and newColor will be an integer in [0, 65535].

735. Asteroid Collision <https://leetcode.com/problems/asteroid-collision> "We are given an array asteroids of integers representing asteroids in a row.

For each asteroid, the absolute value represents its size, and the sign represents its direction (positive meaning right, negative meaning left). Each asteroid moves at the same speed.

Find out the state of the asteroids after all collisions. If two asteroids meet, the smaller one will explode. If both are the same size, both will explode. Two asteroids moving in the same direction will never meet.

Example 1:

Input:
 asteroids = [5, 10, -5]
 Output: [5, 10]
 Explanation:
 The 10 and -5 collide resulting in 10. The 5 and 10 never collide.

Example 2:

Input:
 asteroids = [8, -8]
 Output: []
 Explanation:
 The 8 and -8 collide exploding each other.

Example 3:

Input:
 asteroids = [10, 2, -5]
 Output: [10]
 Explanation:
 The 2 and -5 collide resulting in -5. The 10 and -5 collide resulting in 10.

Example 4:

Input:
 asteroids = [-2, -1, 1, 2]
 Output: [-2, -1, 1, 2]
 Explanation:
 The -2 and -1 are moving left, while the 1 and 2 are moving right.
 Asteroids moving the same direction never meet, so no asteroids will meet each other.

Note:

The length of asteroids will be at most 10000.
 Each asteroid will be a non-zero integer in the range [-1000, 1000].
 736. Parse Lisp Expression <https://leetcode.com/problems/parse-lisp-expression> "You are given a string expression representing a Lisp-like expression to return the integer value of."

The syntax for these expressions is given as follows.

An expression is either an integer, a let-expression, an add-expression, a mult-expression, or an assigned variable. Expressions always evaluate to a single integer.

(An integer could be positive or negative.)

A let-expression takes the form (let v1 e1 v2 e2 ... vn en expr), where let is always the string "let", then there are 1 or more pairs of alternating variables and expressions, meaning that the first variable v1 is assigned the value of the expression e1, the second variable v2 is assigned the value of the expression e2, and so on sequentially; and then the value of this let-expression is the value of the expression expr.

An add-expression takes the form (add e1 e2) where add is always the string "add", there are always two expressions e1, e2, and this expression evaluates to the addition of the evaluation of e1 and the evaluation of e2.

A mult-expression takes the form (mult e1 e2) where mult is always the string "mult", there are always two expressions e1, e2, and this expression evaluates to the multiplication of the evaluation of e1 and the evaluation of e2.

For the purposes of this question, we will use a smaller subset of variable names. A variable starts with a lowercase letter, then zero or more lowercase letters or digits. Additionally for your convenience, the names "add", "let", or "mult" are protected and will never be used as variable names.

Finally, there is the concept of scope. When an expression of a variable name is evaluated, within the context of that evaluation, the innermost scope (in terms of parentheses) is checked first for the value of that variable, and then outer scopes are checked sequentially. It is guaranteed that every expression is legal. Please see the examples for more details on scope.

Evaluation Examples:

Input: (add 1 2)
Output: 3

Input: (mult 3 (add 2 3))
Output: 15

Input: (let x 2 (mult x 5))
Output: 10

Input: (let x 2 (mult x (let x 3 y 4 (add x y))))
Output: 14

Explanation: In the expression (add x y), when checking for the value of the variable x, we check from the innermost scope to the outermost in the context of the variable we are trying to evaluate. Since x = 3 is found first, the value of x is 3.

Input: (let x 3 x 2 x)
Output: 2
Explanation: Assignment in let statements is processed sequentially.

Input: (let x 1 y 2 x (add x y) (add x y))
Output: 5
Explanation: The first (add x y) evaluates as 3, and is assigned to x. The second (add x y) evaluates as 3+2 = 5.

Input: (let x 2 (add (let x 3 (let x 4 x)) x))
Output: 6
Explanation: Even though (let x 4 x) has a deeper scope, it is outside the context of the final x in the add-expression. That final x will equal 2.

Input: (let a1 3 b2 (add a1 1) b2)
Output: 4
Explanation: Variable names can contain digits after the first character.

Note:

The given string expression is well formatted: There are no leading or trailing spaces, there is only a single space separating different components of the string, and no space between adjacent parentheses. The expression is guaranteed to be legal and evaluate to an integer.

The length of expression is at most 2000. (It is also non-empty, as that would not be a legal expression.)

The answer and all intermediate calculations of that answer are guaranteed to fit in a 32-bit integer."

738. Monotone Increasing Digits <https://leetcode.com/problems/monotone-increasing-digits> "Given a non-negative integer N, find the largest number that is less than or equal to N with monotone increasing digits.

(Recall that an integer has monotone increasing digits if and only if each pair of adjacent digits x and y satisfy x <= y.)

Example 1:

Input: N = 10
Output: 9

Example 2:

Input: N = 1234
Output: 1234

Example 3:

Input: N = 332
Output: 299

Note:

N is an integer in the range $[0, 10^9]$.

739. Daily Temperatures <https://leetcode.com/problems/daily-temperatures> "Given a list of daily temperatures, produce a list that, for each day in the input, tells you how many days you would have to wait until a warmer temperature. If there is no future day for which this is possible, put 0 instead.

For example, given the list temperatures = [73, 74, 75, 71, 69, 72, 76, 73], your output should be [1, 1, 4, 2, 1, 1, 0, 0].

Note:

The length of temperatures will be in the range $[1, 30000]$.

Each temperature will be an integer in the range $[30, 100]$.

740. Delete and Earn <https://leetcode.com/problems/delete-and-earn> "Given an array nums of integers, you can perform operations on the array.

In each operation, you pick any nums[i] and delete it to earn nums[i] points. After, you must delete every element equal to nums[i] - 1 or nums[i] + 1.

You start with 0 points. Return the maximum number of points you can earn by applying such operations.

Example 1:

Input: nums = [3, 4, 2]

Output: 6

Explanation:

Delete 4 to earn 4 points, consequently 3 is also deleted.

Then, delete 2 to earn 2 points. 6 total points are earned.

Example 2:

Input: nums = [2, 2, 3, 3, 3, 4]

Output: 9

Explanation:

Delete 3 to earn 3 points, deleting both 2's and the 4.

Then, delete 3 again to earn 3 points, and 3 again to earn 3 points.

9 total points are earned.

Note:

The length of nums is at most 20000.

Each element nums[i] is an integer in the range $[1, 10000]$.

741. Cherry Pickup <https://leetcode.com/problems/cherry-pickup> "In a $N \times N$ grid representing a field of cherries, each cell is one of three possible integers.

0 means the cell is empty, so you can pass through;

1 means the cell contains a cherry, that you can pick up and pass through;

-1 means the cell contains a thorn that blocks your way.

Your task is to collect maximum number of cherries possible by following the rules below:

Starting at the position (0, 0) and reaching (N-1, N-1) by moving right or down through valid path cells (cells with value 0 or 1);

After reaching (N-1, N-1), returning to (0, 0) by moving left or up through valid pa

th cells;
 When passing through a path cell containing a cherry, you pick it up and the cell becomes an empty cell (0);
 If there is no valid path between (0, 0) and (N-1, N-1), then no cherries can be collected.

Example 1:

Input: grid =
 [[0, 1, -1],
 [1, 0, -1],
 [1, 1, 1]]

Output: 5

Explanation:

The player started at (0, 0) and went down, down, right right to reach (2, 2). 4 cherries were picked up during this single trip, and the matrix becomes [[0,1,-1], [0,0,-1],[0,0,0]]. Then, the player went left, up, up, left to return home, picking up one more cherry. The total number of cherries picked up is 5, and this is the maximum possible.

Note:

grid is an N by N 2D array, with $1 \leq N \leq 50$.

Each grid[i][j] is an integer in the set {-1, 0, 1}.

It is guaranteed that grid[0][0] and grid[N-1][N-1] are not -1."

743. Network Delay Time <https://leetcode.com/problems/network-delay-time> "There are N network nodes, labelled 1 to N.

Given times, a list of travel times as directed edges times[i] = (u, v, w), where u is the source node, v is the target node, and w is the time it takes for a signal to travel from source to target.

Now, we send a signal from a certain node K. How long will it take for all nodes to receive the signal? If it is impossible, return -1.

Note:

N will be in the range [1, 100].

K will be in the range [1, N].

The length of times will be in the range [1, 6000].

All edges times[i] = (u, v, w) will have $1 \leq u, v \leq N$ and $1 \leq w \leq 100$."

744. Find Smallest Letter Greater Than Target <https://leetcode.com/problems/find-smallest-letter-greater-than-target> "Given a list of sorted characters letters containing only lowercase letters, and given a target letter target, find the smallest element in the list that is larger than the given target.

Letters also wrap around. For example, if the target is target = 'z' and letters = ['a', 'b'], the answer is 'a'.

Examples:

Input:
 letters = ["c", "f", "j"]
 target = "a"
 Output: "c"

Input:
 letters = ["c", "f", "j"]
 target = "c"
 Output: "f"

Input:
 letters = ["c", "f", "j"]
 target = "d"
 Output: "f"

Input:
 letters = ["c", "f", "j"]

```
target = "g"
Output: "j"
```

```
Input:
letters = ["c", "f", "j"]
target = "j"
Output: "c"
```

```
Input:
letters = ["c", "f", "j"]
target = "k"
Output: "c"
```

Note:

letters has a length in range [2, 10000].
 letters consists of lowercase letters, and contains at least 2 unique letters.
 target is a lowercase letter."
 745. Prefix and Suffix Search <https://leetcode.com/problems/prefix-and-suffix-search>
 "Given many words, words[i] has weight i.

Design a class WordFilter that supports one function, WordFilter.f(String prefix, String suffix).
 It will return the word with given prefix and suffix with maximum weight. If no word exists, return -1.

Examples:

```
Input:
WordFilter(["apple"])
WordFilter.f("a", "e") // returns 0
WordFilter.f("b", "") // returns -1
```

Note:

words has length in range [1, 15000].
 For each test case, up to words.length queries WordFilter.f may be made.
 words[i] has length in range [1, 10].
 prefix, suffix have lengths in range [0, 10].
 words[i] and prefix, suffix queries consist of lowercase letters only."
 746. Min Cost Climbing Stairs <https://leetcode.com/problems/min-cost-climbing-stairs>
 "On a staircase, the i-th step has some non-negative cost cost[i] assigned (0 indexed).

Once you pay the cost, you can either climb one or two steps. You need to find minimum cost to reach the top of the floor, and you can either start from the step with index 0, or the step with index 1.

Example 1:

```
Input: cost = [10, 15, 20]
Output: 15
Explanation: Cheapest is start on cost[1], pay that cost and go to the top.
```

Example 2:

```
Input: cost = [1, 100, 1, 1, 1, 100, 1, 1, 100, 1]
Output: 6
Explanation: Cheapest is start on cost[0], and only step on 1s, skipping cost[3].
```

Note:

cost will have a length in the range [2, 1000].
 Every cost[i] will be an integer in the range [0, 999]."
 747. Largest Number At Least Twice of Others <https://leetcode.com/problems/largest-number-at-least-twice-of-others> "In a given integer array nums, there is always exactly one largest element.

Find whether the largest element in the array is at least twice as much as every other number in the array.

If it is, return the index of the largest element, otherwise return -1.

Example 1:

Input: nums = [3, 6, 1, 0]

Output: 1

Explanation: 6 is the largest integer, and for every other number in the array x, 6 is more than twice as big as x. The index of value 6 is 1, so we return 1.

Example 2:

Input: nums = [1, 2, 3, 4]

Output: -1

Explanation: 4 isn't at least as big as twice the value of 3, so we return -1.

Note:

nums will have a length in the range [1, 50].
 Every nums[i] will be an integer in the range [0, 99]."
 748. Shortest Completing Word <https://leetcode.com/problems/shortest-completing-word> "Find the minimum length word from a given dictionary words, which has all the letters from the string licensePlate. Such a word is said to complete the given string licensePlate

Here, for letters we ignore case. For example, "P" on the licensePlate still matches "p" on the word.

It is guaranteed an answer exists. If there are multiple answers, return the one that occurs first in the array.

The license plate might have the same letter occurring multiple times. For example, given a licensePlate of "PP", the word "pair" does not complete the licensePlate, but the word "supper" does.

Example 1:

Input: licensePlate = "1s3 PSt", words = ["step", "steps", "stripe", "stepple"]

Output: "steps"

Explanation: The smallest length word that contains the letters "S", "P", "S", and "T".

Note that the answer is not "step", because the letter "s" must occur in the word twice.

Also note that we ignored case for the purposes of comparing whether a letter exists in the word.

Example 2:

Input: licensePlate = "1s3 456", words = ["looks", "pest", "stew", "show"]

Output: "pest"

Explanation: There are 3 smallest length words that contains the letters "s". We return the one that occurred first.

Note:

licensePlate will be a string with length in range [1, 7].
 licensePlate will contain digits, spaces, or letters (uppercase or lowercase).
 words will have a length in the range [10, 1000].
 Every words[i] will consist of lowercase letters, and have length in range [1, 15]."
 749. Contain Virus <https://leetcode.com/problems/contain-virus> "A virus is spreading rapidly, and your task is to quarantine the infected area by installing walls.

The world is modeled as a 2-D array of cells, where 0 represents uninfected cells, and 1 represents cells contaminated with the virus. A wall (and only one wall) can be installed between any two 4-directionally adjacent cells, on the shared boundary.

Every night, the virus spreads to all neighboring cells in all four directions unless blocked by a wall.
 Resources are limited. Each day, you can install walls around only one region -- the affected area (continuous block of infected cells) that threatens the most uninfected cells the following night. There will never be a tie.

Can you save the day? If so, what is the number of walls required? If not, and the world becomes fully infected, return the number of walls used.

Example 1:

Input: grid =
 [[0,1,0,0,0,0,0,1],
 [0,1,0,0,0,0,0,1],
 [0,0,0,0,0,0,0,1],
 [0,0,0,0,0,0,0,0]]

Output: 10

Explanation:

There are 2 contaminated regions.

On the first day, add 5 walls to quarantine the viral region on the left. The board after the virus spreads is:

[[0,1,0,0,0,0,1,1],
 [0,1,0,0,0,0,1,1],
 [0,0,0,0,0,0,1,1],
 [0,0,0,0,0,0,0,1]]

On the second day, add 5 walls to quarantine the viral region on the right. The virus is fully contained.

Example 2:

Input: grid =
 [[1,1,1],
 [1,0,1],
 [1,1,1]]

Output: 4

Explanation: Even though there is only one cell saved, there are 4 walls built. Notice that walls are only built on the shared boundary of two different cells.

Example 3:

Input: grid =
 [[1,1,1,0,0,0,0,0,0],
 [1,0,1,0,1,1,1,1,1],
 [1,1,1,0,0,0,0,0,0]]

Output: 13

Explanation: The region on the left only builds two new walls.

Note:

The number of rows and columns of grid will each be in the range [1, 50].

Each grid[i][j] will be either 0 or 1.

Throughout the described process, there is always a contiguous viral region that will infect strictly more uncontaminated squares in the next round."

752. Open the Lock <https://leetcode.com/problems/open-the-lock> "You have a lock in front of you with 4 circular wheels. Each wheel has 10 slots: '0', '1', '2', '3', '4', '5', '6', '7', '8', '9'. The wheels can rotate freely and wrap around: for example we can turn '9' to be '0', or '0' to be '9'. Each move consists of turning one wheel one slot.

The lock initially starts at '0000', a string representing the state of the 4 wheels.

You are given a list of deadends (dead ends, meaning if the lock displays any of these codes, the wheels of the lock will stop turning and you will be unable to open it).

Given a target representing the value of the wheels that will unlock the lock, return the minimum total number of turns required to open the lock, or -1 if it is impossible.

Example 1:

Input: deadends = ["0201","0101","0102","1212","2002"], target = "0202"

Output: 6

Explanation:

A sequence of valid moves would be "0000" -> "1000" -> "1100" -> "1200" -> "1201" -> "1202" -> "0202".

Note that a sequence like "0000" -> "0001" -> "0002" -> "0102" -> "0202" would be invalid, because the wheels of the lock become stuck after the display becomes the dead end "0102".

Example 2:

Input: deadends = ["8888"], target = "0009"

Output: 1

Explanation:

We can turn the last wheel in reverse to move from "0000" -> "0009".

Example 3:

Input: deadends = ["8887","8889","8878","8898","8788","8988","7888","9888"], target = "8888"

Output: -1

Explanation:

We can't reach the target without getting stuck.

Example 4:

Input: deadends = ["0000"], target = "8888"

Output: -1

Note:

The length of deadends will be in the range [1, 500].

target will not be in the list deadends.

Every string in deadends and the string target will be a string of 4 digits from the 10,000 possibilities '0000' to '9999'."

753. Cracking the Safe <https://leetcode.com/problems/cracking-the-safe> "There is a box protected by a password. The password is n digits, where each letter can be one

of the first k digits $0, 1, \dots, k-1$.

You can keep inputting the password, the password will automatically be matched against the last n digits entered.

For example, assuming the password is "345", I can open it when I type "012345", but I enter a total of 6 digits.

Please return any string of minimum length that is guaranteed to open the box after the entire string is inputted.

Example 1:

Input: $n = 1, k = 2$

Output: "01"

Note: "10" will be accepted too.

Example 2:

Input: $n = 2, k = 2$

Output: "00110"

Note: "01100", "10011", "11001" will be accepted too.

Note:

n will be in the range $[1, 4]$.

k will be in the range $[1, 10]$.

k^n will be at most 4096."

754. Reach a Number <https://leetcode.com/problems/reach-a-number> "You are standing at position 0 on an infinite number line. There is a goal at position target.

On each move, you can either go left or right. During the n -th move (starting from 1), you take n steps.

Return the minimum number of steps required to reach the destination.

Example 1:

Input: target = 3

Output: 2

Explanation:

On the first move we step from 0 to 1.

On the second step we step from 1 to 3.

Example 2:

Input: target = 2

Output: 3

Explanation:

On the first move we step from 0 to 1.

On the second move we step from 1 to -1.

On the third move we step from -1 to 2.

Note:

target will be a non-zero integer in the range $[-10^9, 10^9]$."

756. Pyramid Transition Matrix <https://leetcode.com/problems/pyramid-transition-matrix> "We are stacking blocks to form a pyramid. Each block has a color which is a one letter string, like 'Z'.

For every block of color 'C' we place not in the bottom row, we are placing it on top of a left block of color 'A' and right block of color 'B'. We are allowed to place

e the block there only if `(A, B, C)` is an allowed triple.

We start with a bottom row of bottom, represented as a single string. We also start with a list of allowed triples allowed. Each allowed triple is represented as a string of length 3.

Return true if we can build the pyramid all the way to the top, otherwise false.

Example 1:

Input: bottom = "XYZ", allowed = ["XYD", "YZE", "DEA", "FFF"]

Output: true

Explanation:

We can stack the pyramid like this:

```

      A
     /\
    D  E
   /\ /\
  X  Y  Z

```

This works because ('X', 'Y', 'D'), ('Y', 'Z', 'E'), and ('D', 'E', 'A') are allowed triples.

Example 2:

Input: bottom = "XXYX", allowed = ["XXX", "XXY", "XYX", "XYX", "YXZ"]

Output: false

Explanation:

We can't stack the pyramid to the top.

Note that there could be allowed triples (A, B, C) and (A, B, D) with C != D.

Note:

bottom will be a string with length in range [2, 8].

allowed will have length in range [0, 200].

Letters in all strings will be chosen from the set {'A', 'B', 'C', 'D', 'E', 'F', 'G', 'H', 'I', 'J', 'K', 'L', 'M', 'N', 'O', 'P', 'Q', 'R', 'S', 'T', 'U', 'V', 'W', 'X', 'Y', 'Z'}.

757. Set Intersection Size At Least Two <https://leetcode.com/problems/set-intersection-size-at-least-two> "An integer interval [a, b] (for integers a < b) is a set of all consecutive integers from a to b, including a and b.

Find the minimum size of a set S such that for every integer interval A in intervals, the intersection of S with A has size at least 2.

Example 1:

Input: intervals = [[1, 3], [1, 4], [2, 5], [3, 5]]

Output: 3

Explanation:

Consider the set S = {2, 3, 4}. For each interval, there are at least 2 elements from S in the interval.

Also, there isn't a smaller size set that fulfills the above condition.

Thus, we output the size of this set, which is 3.

Example 2:

Input: intervals = [[1, 2], [2, 3], [2, 4], [4, 5]]

Output: 5

Explanation:

An example of a minimum sized set is {1, 2, 3, 4, 5}.

Note:

intervals will have length in range $[1, 3000]$.
 intervals[i] will have length 2, representing some integer interval.
 intervals[i][j] will be an integer in $[0, 10^8]$."¿
 761. Special Binary String <https://leetcode.com/problems/special-binary-string> "Special binary strings are binary strings with the following two properties:

The number of 0's is equal to the number of 1's.
 Every prefix of the binary string has at least as many 1's as 0's.

Given a special string S, a move consists of choosing two consecutive, non-empty, special substrings of S, and swapping them. (Two strings are consecutive if the last character of the first string is exactly one index before the first character of the second string.)

At the end of any number of moves, what is the lexicographically largest resulting string possible?

Example 1:

Input: S = "11011000"

Output: "11100100"

Explanation:

The strings "10" [occurring at S[1]] and "1100" [at S[3]] are swapped.

This is the lexicographically largest string possible after some number of swaps.

Note:

S has length at most 50.

S is guaranteed to be a special binary string as defined above."¿

762. Prime Number of Set Bits in Binary Representation <https://leetcode.com/problems/prime-number-of-set-bits-in-binary-representation> "Given two integers L and R, find the count of numbers in the range [L, R] (inclusive) having a prime number of set bits in their binary representation.

(Recall that the number of set bits an integer has is the number of 1s present when written in binary. For example, 21 written in binary is 10101 which has 3 set bits. Also, 1 is not a prime.)

Example 1:

Input: L = 6, R = 10

Output: 4

Explanation:

6 -> 110 (2 set bits, 2 is prime)

7 -> 111 (3 set bits, 3 is prime)

9 -> 1001 (2 set bits, 2 is prime)

10 -> 1010 (2 set bits, 2 is prime)

Example 2:

Input: L = 10, R = 15

Output: 5

Explanation:

10 -> 1010 (2 set bits, 2 is prime)

11 -> 1011 (3 set bits, 3 is prime)

12 -> 1100 (2 set bits, 2 is prime)

13 -> 1101 (3 set bits, 3 is prime)

14 -> 1110 (3 set bits, 3 is prime)

15 -> 1111 (4 set bits, 4 is not prime)

Note:

L, R will be integers $L \leq R$ in the range $[1, 10^6]$.

R - L will be at most 10000."¿

763. Partition Labels <https://leetcode.com/problems/partition-labels> "A string S of lowercase letters is given. We want to partition this string into as many parts as possible so that each letter appears in at most one part, and return a list of integers representing the size of these parts.

Example 1:

Input: S = "ababcbacadefegdehijhklij"

Output: [9,7,8]

Explanation:

The partition is "ababcbaca", "defegde", "hijhklij".

This is a partition so that each letter appears in at most one part.

A partition like "ababcbacadefegde", "hijhklij" is incorrect, because it splits S into less parts.

Note:

S will have length in range [1, 500].

S will consist of lowercase letters ('a' to 'z') only."

764. Largest Plus Sign <https://leetcode.com/problems/largest-plus-sign> "In a 2D grid from (0, 0) to (N-1, N-1), every cell contains a 1, except those cells in the given list mines which are 0. What is the largest axis-aligned plus sign of 1s contained in the grid? Return the order of the plus sign. If there is none, return 0.

An "axis-aligned plus sign of 1s of order k" has some center grid[x][y] = 1 along with 4 arms of length k-1 going up, down, left, and right, and made of 1s. This is demonstrated in the diagrams below. Note that there could be 0s or 1s beyond the arms of the plus sign, only the relevant area of the plus sign is checked for 1s.

Examples of Axis-Aligned Plus Signs of Order k:

Order 1:

```
000
010
000
```

Order 2:

```
00000
00100
01110
00100
00000
```

Order 3:

```
0000000
0001000
0001000
0111110
0001000
0001000
0001000
0000000
```

Example 1:

Input: N = 5, mines = [[4, 2]]

Output: 2

Explanation:

```
11111
11111
11111
11111
11011
```

In the above grid, the largest plus sign can only be order 2. One of them is marked in bold.

Example 2:

Input: N = 2, mines = []

Output: 1

Explanation:

There is no plus sign of order 2, but there is of order 1.

Example 3:

Input: N = 1, mines = [[0, 0]]

Output: 0
 Explanation:
 There is no plus sign, so return 0.

Note:

N will be an integer in the range [1, 500].
 mines will have length at most 5000.
 mines[i] will be length 2 and consist of integers in the range [0, N-1].
 (Additionally, programs submitted in C, C++, or C# will be judged with a slightly smaller time limit.)"
 765. Couples Holding Hands <https://leetcode.com/problems/couples-holding-hands> "N couples sit in 2N seats arranged in a row and want to hold hands. We want to know the minimum number of swaps so that every couple is sitting side by side. A swap consists of choosing any two people, then they stand up and switch seats.

The people and seats are represented by an integer from 0 to 2N-1, the couples are numbered in order, the first couple being (0, 1), the second couple being (2, 3), and so on with the last couple being (2N-2, 2N-1).

The couples' initial seating is given by row[i] being the value of the person who is initially sitting in the i-th seat.

Example 1:
 Input: row = [0, 2, 1, 3]
 Output: 1
 Explanation: We only need to swap the second (row[1]) and third (row[2]) person.

Example 2:
 Input: row = [3, 2, 0, 1]
 Output: 0
 Explanation: All couples are already seated side by side.

Note:

len(row) is even and in the range of [4, 60].
 row is guaranteed to be a permutation of 0...len(row)-1."
 766. Toeplitz Matrix <https://leetcode.com/problems/toeplitz-matrix> "A matrix is Toeplitz if every diagonal from top-left to bottom-right has the same element.

Now given an M x N matrix, return True if and only if the matrix is Toeplitz.

Example 1:

Input: matrix = [[1,2,3,4],[5,1,2,3],[9,5,1,2]]
 Output: True
 Explanation:
 1234
 5123
 9512

In the above grid, the diagonals are "[9]", "[5, 5]", "[1, 1, 1]", "[2, 2, 2]", "[3, 3]", "[4]", and in each diagonal all elements are the same, so the answer is True.

Example 2:

Input: matrix = [[1,2],[2,2]]
 Output: False
 Explanation:
 The diagonal "[1, 2]" has different elements.

Note:

matrix will be a 2D array of integers.
 matrix will have a number of rows and columns in range [1, 20].
 matrix[i][j] will be integers in range [0, 99]."

767. Reorganize String <https://leetcode.com/problems/reorganize-string> "Given a string S, check if the letters can be rearranged so that two characters that are adjacent to each other are not the same.

If possible, output any possible result. If not possible, return the empty string.

Example 1:

Input: S = "aab"
 Output: "aba"

Example 2:

Input: S = "aaab"
 Output: ""

Note:

S will consist of lowercase letters and have length in range [1, 500]."

768. Max Chunks To Make Sorted II <https://leetcode.com/problems/max-chunks-to-make-sorted-ii> "This question is the same as "Max Chunks to Make Sorted" except the integers of the given array are not necessarily distinct, the input array could be up to length 2000, and the elements could be up to 10^8 .

Given an array arr of integers (not necessarily distinct), we split the array into some number of "chunks" (partitions), and individually sort each chunk. After concatenating them, the result equals the sorted array.

What is the most number of chunks we could have made?

Example 1:

Input: arr = [5,4,3,2,1]
 Output: 1
 Explanation:
 Splitting into two or more chunks will not return the required result.
 For example, splitting into [5, 4], [3, 2, 1] will result in [4, 5, 1, 2, 3], which isn't sorted.

Example 2:

Input: arr = [2,1,3,4,4]
 Output: 4
 Explanation:
 We can split into two chunks, such as [2, 1], [3, 4, 4].
 However, splitting into [2, 1], [3], [4], [4] is the highest number of chunks possible.

Note:

arr will have length in range [1, 2000].
 arr[i] will be an integer in range [0, 10^8]."

769. Max Chunks To Make Sorted <https://leetcode.com/problems/max-chunks-to-make-sorted> "Given an array arr that is a permutation of [0, 1, ..., arr.length - 1], we split the array into some number of "chunks" (partitions), and individually sort each chunk. After concatenating them, the result equals the sorted array.

What is the most number of chunks we could have made?

Example 1:

Input: arr = [4,3,2,1,0]

Output: 1

Explanation:

Splitting into two or more chunks will not return the required result.

For example, splitting into [4, 3], [2, 1, 0] will result in [3, 4, 0, 1, 2], which isn't sorted.

Example 2:

Input: arr = [1,0,2,3,4]

Output: 4

Explanation:

We can split into two chunks, such as [1, 0], [2, 3, 4].

However, splitting into [1, 0], [2], [3], [4] is the highest number of chunks possible.

Note:

arr will have length in range [1, 10].

arr[i] will be a permutation of [0, 1, ..., arr.length - 1]."

770. Basic Calculator IV <https://leetcode.com/problems/basic-calculator-iv> "Given an expression such as expression = "e + 8 - a + 5" and an evaluation map such as {"e": 1} (given in terms of evalvars = ["e"] and evalints = [1]), return a list of tokens representing the simplified expression, such as ["-1*a", "14"]

An expression alternates chunks and symbols, with a space separating each chunk and symbol.

A chunk is either an expression in parentheses, a variable, or a non-negative integer.

A variable is a string of lowercase letters (not including digits.) Note that variables can be multiple letters, and note that variables never have a leading coefficient or unary operator like "2x" or "-x".

Expressions are evaluated in the usual order: brackets first, then multiplication, then addition and subtraction. For example, expression = "1 + 2 * 3" has an answer of ["7"].

The format of the output is as follows:

For each term of free variables with non-zero coefficient, we write the free variables within a term in sorted order lexicographically. For example, we would never write a term like "b*a*c", only "a*b*c".

Terms have degree equal to the number of free variables being multiplied, counting multiplicity. (For example, "a*a*b*c" has degree 4.) We write the largest degree terms of our answer first, breaking ties by lexicographic order ignoring the leading coefficient of the term.

The leading coefficient of the term is placed directly to the left with an asterisk separating it from the variables (if they exist.) A leading coefficient of 1 is still printed.

An example of a well formatted answer is ["-2*a*a*a", "3*a*a*b", "3*b*b", "4*a", "5*c", "-6"]

Terms (including constant terms) with coefficient 0 are not included. For example, an expression of "0" has an output of [].

Examples:

Input: expression = "e + 8 - a + 5", evalvars = ["e"], evalints = [1]

Output: ["-1*a", "14"]

Input: expression = "e - 8 + temperature - pressure",

evalvars = ["e", "temperature"], evalints = [1, 12]

Output: ["-1*pressure", "5"]

Input: expression = "(e + 8) * (e - 8)", evalvars = [], evalints = []

Output: ["1*e*e", "-64"]

Input: expression = "7 - 7", evalvars = [], evalints = []

Output: []

Input: expression = "a * b * c + b * a * c * 4", evalvars = [], evalints = []
Output: ["5*a*b*c"]

Input: expression = "((a - b) * (b - c) + (c - a)) * ((a - b) + (b - c) * (c - a))"
evalvars = [], evalints = []
Output: ["-1*a*a*b*b", "2*a*a*b*c", "-1*a*a*c*c", "1*a*b*b*b", "-1*a*b*b*c", "-1*a*b*c*c", "1*a*c*c*c", "-1*b*b*b*c", "2*b*b*c*c", "-1*b*c*c*c", "2*a*a*b", "-2*a*a*c", "-2*a*b*b", "2*a*c*c", "1*b*b*b", "-1*b*b*c", "1*b*c*c", "-1*c*c*c", "-1*a*a", "1*a*b", "1*a*c", "-1*b*c"]

Note:

expression will have length in range [1, 250].

evalvars, evalints will have equal lengths in range [0, 100]."

771. Jewels and Stones <https://leetcode.com/problems/jewels-and-stones> "You're given n strings J representing the types of stones that are jewels, and S representing the stones you have. Each character in S is a type of stone you have. You want to know how many of the stones you have are also jewels.

The letters in J are guaranteed distinct, and all characters in J and S are letters. Letters are case sensitive, so "a" is considered a different type of stone from "A".

Example 1:

Input: J = "aA", S = "aAAbbbb"
Output: 3

Example 2:

Input: J = "z", S = "zz"
Output: 0

Note:

S and J will consist of letters and have length at most 50.

The characters in J are distinct."

773. Sliding Puzzle <https://leetcode.com/problems/sliding-puzzle> "On a 2x3 board, there are 5 tiles represented by the integers 1 through 5, and an empty square represented by 0.

A move consists of choosing 0 and a 4-directionally adjacent number and swapping it.

The state of the board is solved if and only if the board is [[1,2,3],[4,5,0]].

Given a puzzle board, return the least number of moves required so that the state of the board is solved. If it is impossible for the state of the board to be solved, return -1.

Examples:

Input: board = [[1,2,3],[4,0,5]]
Output: 1
Explanation: Swap the 0 and the 5 in one move.

Input: board = [[1,2,3],[5,4,0]]
Output: -1
Explanation: No number of moves will make the board solved.

Input: board = [[4,1,2],[5,0,3]]
Output: 5
Explanation: 5 is the smallest number of moves that solves the board.
An example path:

```

After move 0: [[4,1,2],[5,0,3]]
After move 1: [[4,1,2],[0,5,3]]
After move 2: [[0,1,2],[4,5,3]]
After move 3: [[1,0,2],[4,5,3]]
After move 4: [[1,2,0],[4,5,3]]
After move 5: [[1,2,3],[4,5,0]]

```

```

Input: board = [[3,2,4],[1,5,0]]
Output: 14

```

Note:

board will be a 2 x 3 array as described above.

board[i][j] will be a permutation of [0, 1, 2, 3, 4, 5]."

775. Global and Local Inversions <https://leetcode.com/problems/global-and-local-inversions> "We have some permutation A of [0, 1, ..., N - 1], where N is the length of A.

The number of (global) inversions is the number of $i < j$ with $0 \leq i < j < N$ and $A[i] > A[j]$.

The number of local inversions is the number of i with $0 \leq i < N$ and $A[i] > A[i+1]$.

Return true if and only if the number of global inversions is equal to the number of local inversions.

Example 1:

Input: A = [1,0,2]

Output: true

Explanation: There is 1 global inversion, and 1 local inversion.

Example 2:

Input: A = [1,2,0]

Output: false

Explanation: There are 2 global inversions, and 1 local inversion.

Note:

A will be a permutation of [0, 1, ..., A.length - 1].

A will have length in range [1, 5000].

The time limit for this problem has been reduced."

777. Swap Adjacent in LR String <https://leetcode.com/problems/swap-adjacent-in-lr-string> "In a string composed of 'L', 'R', and 'X' characters, like "RXXLRXRXL", a move consists of either replacing one occurrence of "XL" with "LX", or replacing one occurrence of "RX" with "XR". Given the starting string start and the ending string end, return True if and only if there exists a sequence of moves to transform one string to the other.

Example:

Input: start = "RXXLRXRXL", end = "XRLXXRRLX"

Output: True

Explanation:

We can transform start to end following these steps:

```

RXXLRXRXL ->
XRXLXRXL ->
XRLXRXL ->
XRLXXRXL ->
XRLXXRRLX

```

Note:

$1 \leq \text{len}(\text{start}) = \text{len}(\text{end}) \leq 10000$.

Both start and end will only consist of characters in {'L', 'R', 'X'}."&
 778. Swim in Rising Water <https://leetcode.com/problems/swim-in-rising-water> "On an $N \times N$ grid, each square $grid[i][j]$ represents the elevation at that point (i,j) .

Now rain starts to fall. At time t , the depth of the water everywhere is t . You can swim from a square to another 4-directionally adjacent square if and only if the elevation of both squares individually are at most t . You can swim infinite distance in zero time. Of course, you must stay within the boundaries of the grid during your swim.

You start at the top left square $(0, 0)$. What is the least time until you can reach the bottom right square $(N-1, N-1)$?

Example 1:

Input: $[[0,2],[1,3]]$

Output: 3

Explanation:

At time 0, you are in grid location $(0, 0)$.

You cannot go anywhere else because 4-directionally adjacent neighbors have a higher elevation than $t = 0$.

You cannot reach point $(1, 1)$ until time 3.

When the depth of water is 3, we can swim anywhere inside the grid.

Example 2:

Input: $[[0,1,2,3,4],[24,23,22,21,5],[12,13,14,15,16],[11,17,18,19,20],[10,9,8,7,6]]$

Output: 16

Explanation:

```

0  1  2  3  4
24 23 22 21 5
12 13 14 15 16
11 17 18 19 20
10 9  8  7  6

```

The final route is marked in bold.

We need to wait until time 16 so that $(0, 0)$ and $(4, 4)$ are connected.

Note:

$2 \leq N \leq 50$.

$grid[i][j]$ is a permutation of $[0, \dots, N*N - 1]$."

779. K-th Symbol in Grammar <https://leetcode.com/problems/k-th-symbol-in-grammar>

"On the first row, we write a 0. Now in every subsequent row, we look at the previous row and replace each occurrence of 0 with 01, and each occurrence of 1 with 10.

Given row N and index K , return the K -th indexed symbol in row N . (The values of K are 1-indexed.) (1 indexed).

Examples:

Input: $N = 1, K = 1$

Output: 0

Input: $N = 2, K = 1$

Output: 0

Input: $N = 2, K = 2$

Output: 1

Input: $N = 4, K = 5$

Output: 1

Explanation:

```

row 1: 0
row 2: 01
row 3: 0110
row 4: 01101001

```

Note:

N will be an integer in the range [1, 30].

K will be an integer in the range [1, 2^(N-1)]."

780. Reaching Points <https://leetcode.com/problems/reaching-points> "A move consists of taking a point (x, y) and transforming it to either (x, x+y) or (x+y, y).

Given a starting point (sx, sy) and a target point (tx, ty), return True if and only if a sequence of moves exists to transform the point (sx, sy) to (tx, ty). Otherwise, return False.

Examples:

Input: sx = 1, sy = 1, tx = 3, ty = 5

Output: True

Explanation:

One series of moves that transforms the starting point to the target is:

(1, 1) -> (1, 2)

(1, 2) -> (3, 2)

(3, 2) -> (3, 5)

Input: sx = 1, sy = 1, tx = 2, ty = 2

Output: False

Input: sx = 1, sy = 1, tx = 1, ty = 1

Output: True

Note:

sx, sy, tx, ty will all be integers in the range [1, 10⁹]."

781. Rabbits in Forest <https://leetcode.com/problems/rabbits-in-forest> "In a forest, each rabbit has some color. Some subset of rabbits (possibly all of them) tell you how many other rabbits have the same color as them. Those answers are placed in an array.

Return the minimum number of rabbits that could be in the forest.

Examples:

Input: answers = [1, 1, 2]

Output: 5

Explanation:

The two rabbits that answered "1" could both be the same color, say red.

The rabbit that answered "2" can't be red or the answers would be inconsistent.

Say the rabbit that answered "2" was blue.

Then there should be 2 other blue rabbits in the forest that didn't answer into the array.

The smallest possible number of rabbits in the forest is therefore 5: 3 that answered plus 2 that didn't.

Input: answers = [10, 10, 10]

Output: 11

Input: answers = []

Output: 0

Note:

answers will have length at most 1000.

Each answers[i] will be an integer in the range [0, 999]."

782. Transform to Chessboard <https://leetcode.com/problems/transform-to-chessboard> "An N x N board contains only 0s and 1s. In each move, you can swap any 2 rows with each other, or any 2 columns with each other.

What is the minimum number of moves to transform the board into a "chessboard" - a board where no 0s and no 1s are 4-directionally adjacent? If the task is impossible, return -1.

Examples:

Input: board = [[0,1,1,0],[0,1,1,0],[1,0,0,1],[1,0,0,1]]

Output: 2

Explanation:

One potential sequence of moves is shown below, from left to right:

```
0110      1010      1010
0110 --> 1010 --> 0101
1001      0101      1010
1001      0101      0101
```

The first move swaps the first and second column.

The second move swaps the second and third row.

Input: board = [[0, 1], [1, 0]]

Output: 0

Explanation:

Also note that the board with 0 in the top left corner,

```
01
10
```

is also a valid chessboard.

Input: board = [[1, 0], [1, 0]]

Output: -1

Explanation:

No matter what sequence of moves you make, you cannot end with a valid chessboard.

Note:

board will have the same number of rows and columns, a number in the range [2, 30].

board[i][j] will be only 0s or 1s."

783. Minimum Distance Between BST Nodes <https://leetcode.com/problems/minimum-distance-between-bst-nodes> "Given a Binary Search Tree (BST) with the root node root, return the minimum difference between the values of any two different nodes in the tree.

Example :

Input: root = [4,2,6,1,3,null,null]

Output: 1

Explanation:

Note that root is a TreeNode object, not an array.

The given tree [4,2,6,1,3,null,null] is represented by the following diagram:

while the minimum difference in this tree is 1, it occurs between node 1 and node 2, also between node 3 and node 2.

Note:

The size of the BST will be between 2 and 100.

The BST is always valid, each node's value is an integer, and each node's value is different."

784. Letter Case Permutation <https://leetcode.com/problems/letter-case-permutation> "Given a string S, we can transform every letter individually to be lowercase or uppercase to create another string. Return a list of all possible strings we could create.

Examples:

Input: S = "a1b2"

Output: ["a1b2", "a1B2", "A1b2", "A1B2"]

Input: S = "3z4"
 Output: ["3z4", "3Z4"]

Input: S = "12345"
 Output: ["12345"]

Note:

S will be a string with length at most 12.

S will consist only of letters or digits."

785. Is Graph Bipartite? <https://leetcode.com/problems/is-graph-bipartite> "Given an undirected graph, return true if and only if it is bipartite."

Recall that a graph is bipartite if we can split it's set of nodes into two independent subsets A and B such that every edge in the graph has one node in A and another node in B.

The graph is given in the following form: graph[i] is a list of indexes j for which the edge between nodes i and j exists. Each node is an integer between 0 and graph.length - 1. There are no self edges or parallel edges: graph[i] does not contain i, and it doesn't contain any element twice.

Example 1:

Input: [[1,3], [0,2], [1,3], [0,2]]

Output: true

Explanation:

The graph looks like this:

```

0----1
|    |
|    |
3----2

```

We can divide the vertices into two groups: {0, 2} and {1, 3}.

Example 2:

Input: [[1,2,3], [0,2], [0,1,3], [0,2]]

Output: false

Explanation:

The graph looks like this:

```

0----1
| \  |
|  \ |
3----2

```

We cannot find a way to divide the set of nodes into two independent subsets.

Note:

graph will have length in range [1, 100].

graph[i] will contain integers in range [0, graph.length - 1].

graph[i] will not contain i or duplicate values.

The graph is undirected: if any element j is in graph[i], then i will be in graph[j]."

786. K-th Smallest Prime Fraction <https://leetcode.com/problems/k-th-smallest-prime-fraction> "A sorted list A contains 1, plus some number of primes. Then, for every p < q in the list, we consider the fraction p/q.

What is the K-th smallest fraction considered? Return your answer as an array of ints, where answer[0] = p and answer[1] = q.

Examples:

Input: A = [1, 2, 3, 5], K = 3

Output: [2, 5]

Explanation:

The fractions to be considered in sorted order are:

1/5, 1/3, 2/5, 1/2, 3/5, 2/3.

The third fraction is 2/5.

Input: A = [1, 7], K = 1
 Output: [1, 7]

Note:

A will have length between 2 and 2000.
 Each A[i] will be between 1 and 30000.
 K will be between 1 and $A.length * (A.length - 1) / 2$.
 787. Cheapest Flights Within K Stops <https://leetcode.com/problems/cheapest-flights-within-k-stops> "There are n cities connected by m flights. Each flight starts from city u and arrives at v with a price w.

Now given all the cities and flights, together with starting city src and the destination dst, your task is to find the cheapest price from src to dst with up to k stops. If there is no such route, output -1.

Example 1:

Input:
 n = 3, edges = [[0,1,100],[1,2,100],[0,2,500]]
 src = 0, dst = 2, k = 1
 Output: 200
 Explanation:
 The graph looks like this:

The cheapest price from city 0 to city 2 with at most 1 stop costs 200, as marked red in the picture.

Example 2:

Input:
 n = 3, edges = [[0,1,100],[1,2,100],[0,2,500]]
 src = 0, dst = 2, k = 0
 Output: 500
 Explanation:
 The graph looks like this:

The cheapest price from city 0 to city 2 with at most 0 stop costs 500, as marked blue in the picture.

Note:

The number of nodes n will be in range [1, 100], with nodes labeled from 0 to n - 1.
 The size of flights will be in range [0, $n * (n - 1) / 2$].
 The format of each flight will be (src, dst, price).
 The price of each flight will be in the range [1, 10000].
 k is in the range of [0, n - 1].
 There will not be any duplicated flights or self cycles."
 788. Rotated Digits <https://leetcode.com/problems/rotated-digits> "X is a good number if after rotating each digit individually by 180 degrees, we get a valid number that is different from X. Each digit must be rotated - we cannot choose to leave it alone.

A number is valid if each digit remains a digit after rotation. 0, 1, and 8 rotate to themselves; 2 and 5 rotate to each other; 6 and 9 rotate to each other, and the rest of the numbers do not rotate to any other number and become invalid.

Now given a positive number N, how many numbers X from 1 to N are good?

Example:

Input: 10
 Output: 4
 Explanation:
 There are four good numbers in the range [1, 10] : 2, 5, 6, 9.
 Note that 1 and 10 are not good numbers, since they remain unchanged after rotating.

Note:

N will be in range [1, 10000]."}
 789. Escape The Ghosts <https://leetcode.com/problems/escape-the-ghosts> "You are playing a simplified Pacman game. You start at the point (0, 0), and your destination is (target[0], target[1]). There are several ghosts on the map, the i-th ghost starts at (ghosts[i][0], ghosts[i][1]).

Each turn, you and all ghosts simultaneously *may* move in one of 4 cardinal directions: north, east, west, or south, going from the previous point to a new point 1 unit of distance away.

You escape if and only if you can reach the target before any ghost reaches you (for any given moves the ghosts may take.) If you reach any square (including the target) at the same time as a ghost, it doesn't count as an escape.

Return True if and only if it is possible to escape.

Example 1:

Input:

ghosts = [[1, 0], [0, 3]]

target = [0, 1]

Output: true

Explanation:

You can directly reach the destination (0, 1) at time 1, while the ghosts located at (1, 0) or (0, 3) have no way to catch up with you.

Example 2:

Input:

ghosts = [[1, 0]]

target = [2, 0]

Output: false

Explanation:

You need to reach the destination (2, 0), but the ghost at (1, 0) lies between you and the destination.

Example 3:

Input:

ghosts = [[2, 0]]

target = [1, 0]

Output: false

Explanation:

The ghost can reach the target at the same time as you.

Note:

All points have coordinates with absolute value ≤ 10000 .

The number of ghosts will not exceed 100."}

790. Domino and Tromino Tiling <https://leetcode.com/problems/domino-and-tromino-tiling> "We have two types of tiles: a 2x1 domino shape, and an "L" tromino shape. These shapes may be rotated.

XX <- domino

XX <- "L" tromino

X

Given N, how many ways are there to tile a 2 x N board? Return your answer modulo $10^9 + 7$.

(In a tiling, every square must be covered by a tile. Two tilings are different if and only if there are two 4-directionally adjacent cells on the board such that exactly one of the tilings has both squares occupied by a tile.)

Example:

Input: 3

Output: 5

Explanation:

The five different ways are listed below, different letters indicates different tile S:

XYZ XXZ XYY XXY XYY
XYZ YYZ XZZ XYY XXY

Note:

N will be in range [1, 1000]."

791. Custom Sort String <https://leetcode.com/problems/custom-sort-string> "S and T are strings composed of lowercase letters. In S, no letter occurs more than once.

S was sorted in some custom order previously. We want to permute the characters of T so that they match the order that S was sorted. More specifically, if x occurs before y in S, then x should occur before y in the returned string.

Return any permutation of T (as a string) that satisfies this property.

Example :**Input:**

S = "cba"

T = "abcd"

Output: "cbad"

Explanation:

"a", "b", "c" appear in S, so the order of "a", "b", "c" should be "c", "b", and "a".

Since "d" does not appear in S, it can be at any position in T. "dcba", "cdba", "cbda" are also valid outputs.

Note:

S has length at most 26, and no character is repeated in S.

T has length at most 200.

S and T consist of lowercase letters only."

792. Number of Matching Subsequences <https://leetcode.com/problems/number-of-matching-subsequences> "Given string S and a dictionary of words words, find the number of words[i] that is a subsequence of S.

Example :**Input:**

S = "abcde"

words = ["a", "bb", "acd", "ace"]

Output: 3

Explanation: There are three words in words that are a subsequence of S: "a", "acd", "ace".

Note:

All words in words and S will only consists of lowercase letters.

The length of S will be in the range of [1, 50000].

The length of words will be in the range of [1, 5000].

The length of words[i] will be in the range of [1, 50]."

793. Preimage Size of Factorial Zeroes Function <https://leetcode.com/problems/preimage-size-of-factorial-zeroes-function> "Let f(x) be the number of zeroes at the end of x!. (Recall that $x! = 1 * 2 * 3 * \dots * x$, and by convention, $0! = 1$.)

For example, $f(3) = 0$ because $3! = 6$ has no zeroes at the end, while $f(11) = 2$ because $11! = 39916800$ has 2 zeroes at the end. Given K, find how many non-negative integers x have the property that $f(x) = K$.

Example 1:

Input: K = 0

Output: 5

Explanation: 0!, 1!, 2!, 3!, and 4! end with K = 0 zeroes.

Example 2:

Input: K = 5

Output: 0

Explanation: There is no x such that x! ends in K = 5 zeroes.

Note:

K will be an integer in the range $[0, 10^9]$.
 794. Valid Tic-Tac-Toe State <https://leetcode.com/problems/valid-tic-tac-toe-state>
 "A Tic-Tac-Toe board is given as a string array board. Return True if and only if it is possible to reach this board position during the course of a valid tic-tac-toe game.

The board is a 3 x 3 array, and consists of characters " ", "X", and "O". The " " character represents an empty square.

Here are the rules of Tic-Tac-Toe:

Players take turns placing characters into empty squares (" ").
 The first player always places "X" characters, while the second player always places "O" characters.
 "X" and "O" characters are always placed into empty squares, never filled ones.
 The game ends when there are 3 of the same (non-empty) character filling any row, column, or diagonal.
 The game also ends if all squares are non-empty.
 No more moves can be played if the game is over.

Example 1:

Input: board = ["O ", " ", " "]

Output: false

Explanation: The first player always plays "X".

Example 2:

Input: board = ["XOX", " X ", " "]

Output: false

Explanation: Players take turns making moves.

Example 3:

Input: board = ["XXX", " ", "OOO"]

Output: false

Example 4:

Input: board = ["XOX", "O O", "XOX"]

Output: true

Note:

board is a length-3 array of strings, where each string board[i] has length 3.
 Each board[i][j] is a character in the set {" ", "X", "O"}.
 795. Number of Subarrays with Bounded Maximum <https://leetcode.com/problems/number-of-subarrays-with-bounded-maximum>
 "We are given an array A of positive integers, and two positive integers L and R ($L \leq R$).

Return the number of (contiguous, non-empty) subarrays such that the value of the maximum array element in that subarray is at least L and at most R.

Example :

Input:

A = [2, 1, 4, 3]

L = 2

R = 3

Output: 3

Explanation: There are three subarrays that meet the requirements: [2], [2, 1], [3].

Note:

L, R and A[i] will be an integer in the range $[0, 10^9]$.

The length of A will be in the range of $[1, 50000]$."

796. Rotate String <https://leetcode.com/problems/rotate-string> "We are given two strings, A and B.

A shift on A consists of taking string A and moving the leftmost character to the rightmost position. For example, if A = 'abcde', then it will be 'bcdea' after one shift on A. Return True if and only if A can become B after some number of shifts on A.

Example 1:

Input: A = 'abcde', B = 'cdeab'

Output: true

Example 2:

Input: A = 'abcde', B = 'abced'

Output: false

Note:

A and B will have length at most 100."

797. All Paths From Source to Target <https://leetcode.com/problems/all-paths-from-source-to-target> "Given a directed, acyclic graph of N nodes. Find all possible paths from node 0 to node N-1, and return them in any order.

The graph is given as follows: the nodes are 0, 1, ..., graph.length - 1. graph[i] is a list of all nodes j for which the edge (i, j) exists.

Example:

Input: [[1,2], [3], [3], []]

Output: [[0,1,3],[0,2,3]]

Explanation: The graph looks like this:

```

0--->1
|     |
v     v
2--->3

```

There are two paths: 0 -> 1 -> 3 and 0 -> 2 -> 3.

Note:

The number of nodes in the graph will be in the range $[2, 15]$.

You can print different paths in any order, but you should keep the order of nodes inside one path."

798. Smallest Rotation with Highest Score <https://leetcode.com/problems/smallest-rotation-with-highest-score> "Given an array A, we may rotate it by a non-negative integer K so that the array becomes A[K], A[K+1], A[K+2], ..., A[A.length - 1], A[0], A[1], ..., A[K-1]. Afterward, any entries that are less than or equal to their index are worth 1 point.

For example, if we have [2, 4, 1, 3, 0], and we rotate by K = 2, it becomes [1, 3, 0, 2, 4]. This is worth 3 points because 1 > 0 [no points], 3 > 1 [no points], 0 <= 2 [one point], 2 <= 3 [one point], 4 <= 4 [one point].

Over all possible rotations, return the rotation index K that corresponds to the highest score we could receive. If there are multiple answers, return the smallest such index K.

Example 1:

Input: [2, 3, 1, 4, 0]

Output: 3

Explanation:

Scores for each K are listed below:

K = 0, A = [2,3,1,4,0], score 2

K = 1, A = [3,1,4,0,2], score 3

K = 2, A = [1,4,0,2,3], score 3

K = 3, A = [4,0,2,3,1], score 4

K = 4, A = [0,2,3,1,4], score 3

So we should choose $K = 3$, which has the highest score.

Example 2:

Input: [1, 3, 0, 2, 4]

Output: 0

Explanation: A will always have 3 points no matter how it shifts.
So we will choose the smallest K , which is 0.

Note:

A will have length at most 20000.

$A[i]$ will be in the range $[0, A.length]$."

799. Champagne Tower <https://leetcode.com/problems/champagne-tower> "We stack glasses in a pyramid, where the first row has 1 glass, the second row has 2 glasses, and so on until the 100th row. Each glass holds one cup (250ml) of champagne.

Then, some champagne is poured in the first glass at the top. When the top most glass is full, any excess liquid poured will fall equally to the glass immediately to the left and right of it. When those glasses become full, any excess champagne will fall equally to the left and right of those glasses, and so on. (A glass at the bottom row has its excess champagne fall on the floor.)

For example, after one cup of champagne is poured, the top most glass is full. After two cups of champagne are poured, the two glasses on the second row are half full.

After three cups of champagne are poured, those two cups become full - there are 3 full glasses total now. After four cups of champagne are poured, the third row has the middle glass half full, and the two outside glasses are a quarter full, as pictured below.

Now after pouring some non-negative integer cups of champagne, return how full the j -th glass in the i -th row is (both i and j are 0 indexed.)

Example 1:

Input: poured = 1, query_glass = 1, query_row = 1

Output: 0.0

Explanation: We poured 1 cup of champagne to the top glass of the tower (which is indexed as (0, 0)). There will be no excess liquid so all the glasses under the top glass will remain empty.

Example 2:

Input: poured = 2, query_glass = 1, query_row = 1

Output: 0.5

Explanation: We poured 2 cups of champagne to the top glass of the tower (which is indexed as (0, 0)). There is one cup of excess liquid. The glass indexed as (1, 0) and the glass indexed as (1, 1) will share the excess liquid equally, and each will get half cup of champagne.

Note:

poured will be in the range of $[0, 10^9]$.

query_glass and query_row will be in the range of $[0, 99]$."

801. Minimum Swaps To Make Sequences Increasing <https://leetcode.com/problems/minimum-swaps-to-make-sequences-increasing> "We have two integer sequences A and B of the same non-zero length.

We are allowed to swap elements $A[i]$ and $B[i]$. Note that both elements are in the same index position in their respective sequences.

At the end of some number of swaps, A and B are both strictly increasing. (A sequence is strictly increasing if and only if $A[0] < A[1] < A[2] < \dots < A[A.length - 1]$.)

Given A and B, return the minimum number of swaps to make both sequences strictly increasing. It is guaranteed that the given input always makes it possible.

Example:

Input: A = [1,3,5,4], B = [1,2,3,7]

Output: 1

Explanation:

Swap A[3] and B[3]. Then the sequences are:

A = [1, 3, 5, 7] and B = [1, 2, 3, 4]

which are both strictly increasing.

Note:

A, B are arrays with the same length, and that length will be in the range [1, 1000].

A[i], B[i] are integer values in the range [0, 2000]."

802. Find Eventual Safe States <https://leetcode.com/problems/find-eventual-safe-states> "In a directed graph, we start at some node and every turn, walk along a directed edge of the graph. If we reach a node that is terminal (that is, it has no outgoing directed edges), we stop.

Now, say our starting node is eventually safe if and only if we must eventually walk to a terminal node. More specifically, there exists a natural number K so that for any choice of where to walk, we must have stopped at a terminal node in less than K steps.

Which nodes are eventually safe? Return them as an array in sorted order.

The directed graph has N nodes with labels 0, 1, ..., N-1, where N is the length of graph. The graph is given in the following form: graph[i] is a list of labels j such that (i, j) is a directed edge of the graph.

Example:

Input: graph = [[1,2],[2,3],[5],[0],[5],[],[[]]]

Output: [2,4,5,6]

Here is a diagram of the above graph.

Note:

graph will have length at most 10000.

The number of edges in the graph will not exceed 32000.

Each graph[i] will be a sorted list of different integers, chosen within the range [0, graph.length - 1]."

803. Bricks Falling When Hit <https://leetcode.com/problems/bricks-falling-when-hit> "We have a grid of 1s and 0s; the 1s in a cell represent bricks. A brick will not drop if and only if it is directly connected to the top of the grid, or at least one of its (4-way) adjacent bricks will not drop.

We will do some erasures sequentially. Each time we want to do the erasure at the location (i, j), the brick (if it exists) on that location will disappear, and then some other bricks may drop because of that erasure.

Return an array representing the number of bricks that will drop after each erasure in sequence.

Example 1:

Input:

grid = [[1,0,0,0],[1,1,1,0]]

hits = [[1,0]]

Output: [2]

Explanation:

If we erase the brick at (1, 0), the brick at (1, 1) and (1, 2) will drop. So we should return 2.

Example 2:

Note:

The length of A will be in the range [1, 30].

A[i] will be in the range of [0, 10000]."

806. Number of Lines To Write String <https://leetcode.com/problems/number-of-lines-to-write-string> "We are to write the letters of a given string S, from left to right into lines. Each line has maximum width 100 units, and if writing a letter would cause the width of the line to exceed 100 units, it is written on the next line. We are given an array widths, an array where widths[0] is the width of 'a', widths[1] is the width of 'b', ..., and widths[25] is the width of 'z'.

Now answer two questions: how many lines have at least one character from S, and what is the width used by the last such line? Return your answer as an integer list of length 2.

Example :

Input:

widths = [10,10]

S = "abcdefghijklmnopqrstuvwxyz"

Output: [3, 60]

Explanation:

All letters have the same length of 10. To write all 26 letters, we need two full lines and one line with 60 units.

Example :

Input:

widths = [4,10]

S = "bbbcccdaddaaa"

Output: [2, 4]

Explanation:

All letters except 'a' have the same length of 10, and

"bbbcccdaddaa" will cover $9 * 10 + 2 * 4 = 98$ units.

For the last 'a', it is written on the second line because

there is only 2 units left in the first line.

So the answer is 2 lines, plus 4 units in the second line.

Note:

The length of S will be in the range [1, 1000].

S will only contain lowercase letters.

widths is an array of length 26.

widths[i] will be in the range of [2, 10]."

807. Max Increase to Keep City Skyline <https://leetcode.com/problems/max-increase-to-keep-city-skyline> "In a 2 dimensional array grid, each value grid[i][j] represents the height of a building located there. We are allowed to increase the height of any number of buildings, by any amount (the amounts can be different for different buildings). Height 0 is considered to be a building as well.

At the end, the "skyline" when viewed from all four directions of the grid, i.e. top, bottom, left, and right, must be the same as the skyline of the original grid. A city's skyline is the outer contour of the rectangles formed by all the buildings when viewed from a distance. See the following example.

What is the maximum total sum that the height of the buildings can be increased?

Example:

Input: grid = [[3,0,8,4],[2,4,5,7],[9,2,6,3],[0,3,1,0]]

Output: 35

Explanation:

The grid is:

```
[ [3, 0, 8, 4],
  [2, 4, 5, 7],
```

```
[9, 2, 6, 3],
[0, 3, 1, 0] ]
```

The skyline viewed from top or bottom is: [9, 4, 8, 7]
 The skyline viewed from left or right is: [8, 7, 9, 3]

The grid after increasing the height of buildings without affecting skylines is:

```
gridNew = [ [8, 4, 8, 7],
             [7, 4, 7, 7],
             [9, 4, 8, 7],
             [3, 3, 3, 3] ]
```

Notes:

```
1 < grid.length = grid[0].length <= 50.
All heights grid[i][j] are in the range [0, 100].
All buildings in grid[i][j] occupy the entire grid cell: that is, they are a 1 x
1 x grid[i][j] rectangular prism."?
808. Soup Servings https://leetcode.com/problems/soup-servings "There are two types
of soup: type A and type B. Initially we have N ml of each type of soup. There are
four kinds of operations:
```

```
Serve 100 ml of soup A and 0 ml of soup B
Serve 75 ml of soup A and 25 ml of soup B
Serve 50 ml of soup A and 50 ml of soup B
Serve 25 ml of soup A and 75 ml of soup B
```

When we serve some soup, we give it to someone and we no longer have it. Each turn, we will choose from the four operations with equal probability 0.25. If the remaining volume of soup is not enough to complete the operation, we will serve as much as we can. We stop once we no longer have some quantity of both types of soup.

Note that we do not have the operation where all 100 ml's of soup B are used first.

Return the probability that soup A will be empty first, plus half the probability that A and B become empty at the same time.

Example:

Input: N = 50

Output: 0.625

Explanation:

If we choose the first two operations, A will become empty first. For the third operation, A and B will become empty at the same time. For the fourth operation, B will become empty first. So the total probability of A becoming empty first plus half the probability that A and B become empty at the same time, is $0.25 * (1 + 1 + 0.5 + 0) = 0.625$.

Notes:

```
0 <= N <= 10^9.
```

```
Answers within 10^-6 of the true value will be accepted as correct."?
809. Expressive Words https://leetcode.com/problems/expressive-words "Sometimes people repeat letters to represent extra feeling, such as "hello" -> "heeellooo", "hi" -> "hiiii". Here, we have groups, of adjacent letters that are all the same character, and adjacent characters to the group are different. A group is extended if that group is length 3 or more, so "e" and "o" would be extended in the first example, and "i" would be extended in the second example. As another example, the groups of "abbcccaaaa" would be "a", "bb", "ccc", and "aaaa"; and "cc" and "aaaa" are the extended groups of that string.
```

For some given string S, a query word is stretchy if it can be made to be equal to S

by extending some groups. Formally, we are allowed to repeatedly choose a group (as defined above) of characters c , and add some number of the same character c to it so that the length of the group is 3 or more. Note that we cannot extend a group of size one like "h" to a group of size two like "hh" - all extensions must leave the group extended - ie., at least 3 characters long.

Given a list of query words, return the number of words that are stretchy.

Example:

Input:

$S = \text{"heeellooo"}$

$\text{words} = [\text{"hello"}, \text{"hi"}, \text{"helo"}]$

Output: 1

Explanation:

We can extend "e" and "o" in the word "hello" to get "heeellooo".

We can't extend "helo" to get "heeellooo" because the group "ll" is not extended.

Notes:

$0 \leq \text{len}(S) \leq 100.$

$0 \leq \text{len}(\text{words}) \leq 100.$

$0 \leq \text{len}(\text{words}[i]) \leq 100.$

S and all words in words consist only of lowercase letters.

810. Chalkboard XOR Game <https://leetcode.com/problems/chalkboard-xor-game> "We are given non-negative integers $\text{nums}[i]$ which are written on a chalkboard. Alice and Bob take turns erasing exactly one number from the chalkboard, with Alice starting first. If erasing a number causes the bitwise XOR of all the elements of the chalkboard to become 0, then that player loses. (Also, we'll say the bitwise XOR of one element is that element itself, and the bitwise XOR of no elements is 0.)

Also, if any player starts their turn with the bitwise XOR of all the elements of the chalkboard equal to 0, then that player wins.

Return True if and only if Alice wins the game, assuming both players play optimally.

Example:

Input: $\text{nums} = [1, 1, 2]$

Output: false

Explanation:

Alice has two choices: erase 1 or erase 2.

If she erases 1, the nums array becomes $[1, 2]$. The bitwise XOR of all the elements of the chalkboard is $1 \text{ XOR } 2 = 3$. Now Bob can remove any element he wants, because Alice will be the one to erase the last element and she will lose.

If Alice erases 2 first, now nums becomes $[1, 1]$. The bitwise XOR of all the elements of the chalkboard is $1 \text{ XOR } 1 = 0$. Alice will lose.

Notes:

$1 \leq N \leq 1000.$

$0 \leq \text{nums}[i] \leq 2^{16}.$

811. Subdomain Visit Count <https://leetcode.com/problems/subdomain-visit-count> "A website domain like "discuss.leetcode.com" consists of various subdomains. At the top level, we have "com", at the next level, we have "leetcode.com", and at the lowest level, "discuss.leetcode.com". When we visit a domain like "discuss.leetcode.com", we will also visit the parent domains "leetcode.com" and "com" implicitly.

Now, call a "count-paired domain" to be a count (representing the number of visits this domain received), followed by a space, followed by the address. An example of a count-paired domain might be "9001 discuss.leetcode.com".

We are given a list cpdomains of count-paired domains. We would like a list of count-paired domains, (in the same format as the input, and in any order), that explicitly counts the number of visits to each subdomain.

Example 1:

Input:
 ["9001 discuss.leetcode.com"]
 Output:
 ["9001 discuss.leetcode.com", "9001 leetcode.com", "9001 com"]
 Explanation:
 We only have one website domain: "discuss.leetcode.com". As discussed above, the subdomain "leetcode.com" and "com" will also be visited. So they will all be visited 9001 times.

Example 2:

Input:
 ["900 google.mail.com", "50 yahoo.com", "1 intel.mail.com", "5 wiki.org"]
 Output:
 ["901 mail.com", "50 yahoo.com", "900 google.mail.com", "5 wiki.org", "5 org", "1 intel.mail.com", "951 com"]
 Explanation:
 We will visit "google.mail.com" 900 times, "yahoo.com" 50 times, "intel.mail.com" once and "wiki.org" 5 times. For the subdomains, we will visit "mail.com" $900 + 1 = 901$ times, "com" $900 + 50 + 1 = 951$ times, and "org" 5 times.

Notes:

The length of cpdomains will not exceed 100.
 The length of each domain name will not exceed 100.
 Each address will have either 1 or 2 "." characters.
 The input count in any count-paired domain will not exceed 10000.
 The answer output can be returned in any order."

812. Largest Triangle Area <https://leetcode.com/problems/largest-triangle-area> "You have a list of points in the plane. Return the area of the largest triangle that can be formed by any 3 of the points."

Example:

Input: points = [[0,0],[0,1],[1,0],[0,2],[2,0]]

Output: 2

Explanation:

The five points are shown in the figure below. The red triangle is the largest.

Notes:

$3 \leq \text{points.length} \leq 50$.
 No points will be duplicated.
 $-50 \leq \text{points}[i][j] \leq 50$.
 Answers within 10^{-6} of the true value will be accepted as correct."

813. Largest Sum of Averages <https://leetcode.com/problems/largest-sum-of-averages> "We partition a row of numbers A into at most K adjacent (non-empty) groups, then our score is the sum of the average of each group. What is the largest score we can achieve?"

Note that our partition must use every number in A, and that scores are not necessarily integers.

Example:

Input:

A = [9,1,2,3,9]

K = 3

Output: 20

Explanation:

The best choice is to partition A into [9], [1, 2, 3], [9]. The answer is $9 + (1 + 2 + 3) / 3 + 9 = 20$.

We could have also partitioned A into [9, 1], [2], [3, 9], for example.

That partition would lead to a score of $5 + 2 + 6 = 13$, which is worse.

Note:

```
1 <= A.length <= 100.
```

```
1 <= A[i] <= 10000.
```

```
1 <= K <= A.length.
```

Answers within 10^{-6} of the correct answer will be accepted as correct."

814. Binary Tree Pruning <https://leetcode.com/problems/binary-tree-pruning> "We are given the head node root of a binary tree, where additionally every node's value is either a 0 or a 1.

Return the same tree where every subtree (of the given tree) not containing a 1 has been removed.

(Recall that the subtree of a node X is X, plus every node that is a descendant of X .)

Example 1:

Input: [1,null,0,0,1]

Output: [1,null,0,null,1]

Explanation:

Only the red nodes satisfy the property "every subtree not containing a 1". The diagram on the right represents the answer.

Example 2:

Input: [1,0,1,0,0,0,1]

Output: [1,null,1,null,1]

Example 3:

Input: [1,1,0,1,1,0,1,0]

Output: [1,1,0,1,1,null,1]

Note:

The binary tree will have at most 100 nodes.

The value of each node will only be 0 or 1."

815. Bus Routes <https://leetcode.com/problems/bus-routes> "We have a list of bus routes. Each routes[i] is a bus route that the i-th bus repeats forever. For example if routes[0] = [1, 5, 7], this means that the first bus (0-th indexed) travels in the sequence 1->5->7->1->5->7->1->... forever.

We start at bus stop S (initially not on a bus), and we want to go to bus stop T. Travelling by buses only, what is the least number of buses we must take to reach our destination? Return -1 if it is not possible.

Example:

Input:

routes = [[1, 2, 7], [3, 6, 7]]

S = 1

T = 6

Output: 2

Explanation:

The best strategy is take the first bus to the bus stop 7, then take the second bus to the bus stop 6.

Note:

```

1 <= routes.length <= 500.
1 <= routes[i].length <= 500.
0 <= routes[i][j] < 10 ^ 6."?

```

816. Ambiguous Coordinates <https://leetcode.com/problems/ambiguous-coordinates> "We had some 2-dimensional coordinates, like "(1, 3)" or "(2, 0.5)". Then, we removed all commas, decimal points, and spaces, and ended up with the string S. Return a list of strings representing all possibilities for what our original coordinates could have been.

Our original representation never had extraneous zeroes, so we never started with numbers like "00", "0.0", "0.00", "1.0", "001", "00.01", or any other number that can be represented with less digits. Also, a decimal point within a number never occurs without at least one digit occurring before it, so we never started with numbers like ".1".

The final answer list can be returned in any order. Also note that all coordinates in the final answer have exactly one space between them (occurring after the comma.)

Example 1:

Input: "(123)"

Output: ["(1, 23)", "(12, 3)", "(1.2, 3)", "(1, 2.3)"]

Example 2:

Input: "(00011)"

Output: ["(0.001, 1)", "(0, 0.011)"]

Explanation:

0.0, 00, 0001 or 00.01 are not allowed.

Example 3:

Input: "(0123)"

Output: ["(0, 123)", "(0, 12.3)", "(0, 1.23)", "(0.1, 23)", "(0.1, 2.3)", "(0.12, 3)"]

Example 4:

Input: "(100)"

Output: [(10, 0)]

Explanation:

1.0 is not allowed.

Note:

```

4 <= S.length <= 12.

```

```

S[0] = "(" (", S[S.length - 1] = ")"", and the other elements in S are digits."?

```

817. Linked List Components <https://leetcode.com/problems/linked-list-components> "We are given head, the head node of a linked list containing unique integer values.

We are also given the list G, a subset of the values in the linked list.

Return the number of connected components in G, where two values are connected if they appear consecutively in the linked list.

Example 1:

Input:

head: 0->1->2->3

G = [0, 1, 3]

Output: 2

Explanation:

0 and 1 are connected, so [0, 1] and [3] are the two connected components.

Example 2:

Input:

head: 0->1->2->3->4

G = [0, 3, 1, 4]

Output: 2

Explanation:

0 and 1 are connected, 3 and 4 are connected, so [0, 1] and [3, 4] are the two connected components.

Note:

If N is the length of the linked list given by head, $1 \leq N \leq 10000$.

The value of each node in the linked list will be in the range $[0, N - 1]$.

$1 \leq G.length \leq 10000$.

G is a subset of all values in the linked list."

818. Race Car <https://leetcode.com/problems/race-car> "Your car starts at position 0 and speed +1 on an infinite number line. (Your car can go into negative positions.)

Your car drives automatically according to a sequence of instructions A (accelerate) and R (reverse).

When you get an instruction "A", your car does the following: position += speed, speed *= 2.

When you get an instruction "R", your car does the following: if your speed is positive then speed = -1, otherwise speed = 1. (Your position stays the same.)

For example, after commands "AAR", your car goes to positions 0->1->3->3, and your speed goes to 1->2->4->-1.

Now for some target position, say the length of the shortest sequence of instructions to get there.

Example 1:

Input:

target = 3

Output: 2

Explanation:

The shortest instruction sequence is "AA".

Your position goes from 0->1->3.

Example 2:

Input:

target = 6

Output: 5

Explanation:

The shortest instruction sequence is "AAARA".

Your position goes from 0->1->3->7->7->6.

Note:

$1 \leq \text{target} \leq 10000$."

819. Most Common Word <https://leetcode.com/problems/most-common-word> "Given a paragraph and a list of banned words, return the most frequent word that is not in the list of banned words. It is guaranteed there is at least one word that isn't banned, and that the answer is unique.

Words in the list of banned words are given in lowercase, and free of punctuation. Words in the paragraph are not case sensitive. The answer is in lowercase.

Example:

Input:

paragraph = "Bob hit a ball, the hit BALL flew far after it was hit."

banned = ["hit"]

Output: "ball"

Explanation:

"hit" occurs 3 times, but it is a banned word.

"ball" occurs twice (and no other word does), so it is the most frequent non-banned word in the paragraph.

Note that words in the paragraph are not case sensitive, that punctuation is ignored (even if adjacent to words, such as "ball,"), and that "hit" isn't the answer even though it occurs more because it is banned.

Note:

```
1 <= paragraph.length <= 1000.
1 <= banned.length <= 100.
1 <= banned[i].length <= 10.
The answer is unique, and written in lowercase (even if its occurrences in paragraph may have uppercase symbols, and even if it is a proper noun.)
paragraph only consists of letters, spaces, or the punctuation symbols !?',;.
Different words in paragraph are always separated by a space.
There are no hyphens or hyphenated words.
Words only consist of letters, never apostrophes or other punctuation symbols."
```

820. Short Encoding of Words <https://leetcode.com/problems/short-encoding-of-words> "Given a list of words, we may encode it by writing a reference string S and a list of indexes A.

For example, if the list of words is ["time", "me", "bell"], we can write it as S = "time#bell#" and indexes = [0, 2, 5].

Then for each index, we will recover the word by reading from the reference string from that index until we reach a "#" character.

What is the length of the shortest reference string S possible that encodes the given words?

Example:

Input: words = ["time", "me", "bell"]
Output: 10
Explanation: S = "time#bell#" and indexes = [0, 2, 5].

Note:

```
1 <= words.length <= 2000.
1 <= words[i].length <= 7.
Each word has only lowercase letters."
```

821. Shortest Distance to a Character <https://leetcode.com/problems/shortest-distance-to-a-character> "Given a string S and a character C, return an array of integers representing the shortest distance from the character C in the string.

Example 1:

Input: S = "loveleetcode", C = 'e'
Output: [3, 2, 1, 0, 1, 0, 0, 1, 2, 2, 1, 0]

Note:

```
S string length is in [1, 10000].
C is a single character, and guaranteed to be in string S.
All letters in S and C are lowercase."
```

822. Card Flipping Game <https://leetcode.com/problems/card-flipping-game> "On a table are N cards, with a positive integer printed on the front and back of each card (possibly different).

We flip any number of cards, and after we choose one card.

If the number X on the back of the chosen card is not on the front of any card, then this number X is good.

What is the smallest number that is good? If no number is good, output 0.

Here, `fronts[i]` and `backs[i]` represent the number on the front and back of card `i`.

A flip swaps the front and back numbers, so the value on the front is now on the back and vice versa.

Example:

Input: `fronts = [1,2,4,4,7]`, `backs = [1,3,4,1,3]`

Output: 2

Explanation: If we flip the second card, the fronts are `[1,3,4,4,7]` and the backs are `[1,2,4,1,3]`.

We choose the second card, which has number 2 on the back, and it isn't on the front of any card, so 2 is good.

Note:

```
1 <= fronts.length == backs.length <= 1000.
```

```
1 <= fronts[i] <= 2000.
```

```
1 <= backs[i] <= 2000."
```

823. Binary Trees With Factors <https://leetcode.com/problems/binary-trees-with-factors> "Given an array of unique integers, each integer is strictly greater than 1.

We make a binary tree using these integers and each number may be used for any number of times.

Each non-leaf node's value should be equal to the product of the values of its children.

How many binary trees can we make? Return the answer modulo $10^9 + 7$.

Example 1:

Input: `A = [2, 4]`

Output: 3

Explanation: We can make these trees: `[2]`, `[4]`, `[4, 2, 2]`

Example 2:

Input: `A = [2, 4, 5, 10]`

Output: 7

Explanation: We can make these trees: `[2]`, `[4]`, `[5]`, `[10]`, `[4, 2, 2]`, `[10, 2, 5]`, `[10, 5, 2]`.

Note:

```
1 <= A.length <= 1000.
```

```
2 <= A[i] <= 10 ^ 9."
```

824. Goat Latin <https://leetcode.com/problems/goat-latin> "A sentence `S` is given, composed of words separated by spaces. Each word consists of lowercase and uppercase letters only.

We would like to convert the sentence to "Goat Latin" (a made-up language similar to Pig Latin.)

The rules of Goat Latin are as follows:

If a word begins with a vowel (a, e, i, o, or u), append "ma" to the end of the word.

For example, the word 'apple' becomes 'applema'.

If a word begins with a consonant (i.e. not a vowel), remove the first letter and append it to the end, then add "ma".

For example, the word "goat" becomes "oatgma".

Add one letter 'a' to the end of each word per its word index in the sentence, starting with 1.

For example, the first word gets "a" added to the end, the second word gets "aa" added to the end and so on.

Return the final sentence representing the conversion from S to Goat Latin.

Example 1:

Input: "I speak Goat Latin"

Output: "Imaa peaksmaaa oatGmaaaa atinLmaaaaa"

Example 2:

Input: "The quick brown fox jumped over the lazy dog"

Output: "heTmaa uickqmaaaa rownbmaaaaa oxfmaaaaaa umpedjmaaaaaa overmaaaaaa hetmaaaaaa aazylmaaaaaa ogdmaaaaaa"

Notes:

S contains only uppercase, lowercase and spaces. Exactly one space between each word.

1 <= S.length <= 150."

825. Friends Of Appropriate Ages <https://leetcode.com/problems/friends-of-appropriate-ages> "Some people will make friend requests. The list of their ages is given and ages[i] is the age of the ith person.

Person A will NOT friend request person B (B != A) if any of the following conditions are true:

```
age[B] <= 0.5 * age[A] + 7
age[B] > age[A]
age[B] > 100 && age[A] < 100
```

Otherwise, A will friend request B.

Note that if A requests B, B does not necessarily request A. Also, people will not friend request themselves.

How many total friend requests are made?

Example 1:

Input: [16,16]

Output: 2

Explanation: 2 people friend request each other.

Example 2:

Input: [16,17,18]

Output: 2

Explanation: Friend requests are made 17 -> 16, 18 -> 17.

Example 3:

Input: [20,30,100,110,120]

Output:

Explanation: Friend requests are made 110 -> 100, 120 -> 110, 120 -> 100.

Notes:

```
1 <= ages.length <= 20000.
1 <= ages[i] <= 120."¿
826. Most Profit Assigning Work https://leetcode.com/problems/most-profit-assigning-work
    "We have jobs: difficulty[i] is the difficulty of the ith job, and profit[i]
    is the profit of the ith job.
```

Now we have some workers. worker[i] is the ability of the ith worker, which means that at this worker can only complete a job with difficulty at most worker[i].

Every worker can be assigned at most one job, but one job can be completed multiple times.

For example, if 3 people attempt the same job that pays \$1, then the total profit will be \$3. If a worker cannot complete any job, his profit is \$0.

What is the most profit we can make?

Example 1:

```
Input: difficulty = [2,4,6,8,10], profit = [10,20,30,40,50], worker = [4,5,6,7]
Output: 100
Explanation: Workers are assigned jobs of difficulty [4,4,6,6] and they get profit of [20,20,30,30] separately.
```

Notes:

```
1 <= difficulty.length = profit.length <= 10000
1 <= worker.length <= 10000
difficulty[i], profit[i], worker[i] are in range [1, 10^5]"¿
827. Making A Large Island https://leetcode.com/problems/making-a-large-island
    "In a 2D grid of 0s and 1s, we change at most one 0 to a 1.
```

After, what is the size of the largest island? (An island is a 4-directionally connected group of 1s).

Example 1:

```
Input: [[1, 0], [0, 1]]
Output: 3
Explanation: Change one 0 to 1 and connect two 1s, then we get an island with area = 3.
```

Example 2:

```
Input: [[1, 1], [1, 0]]
Output: 4
Explanation: Change the 0 to 1 and make the island bigger, only one island with area = 4.
```

Example 3:

```
Input: [[1, 1], [1, 1]]
Output: 4
Explanation: Can't change any 0 to 1, only one island with area = 4.
```

Notes:

```
1 <= grid.length = grid[0].length <= 50.
0 <= grid[i][j] <= 1."
```
